## Beamex POC8 AUTOMATIC PRESSURE CONTROLLER

## **User Manual**

Dear user,

We have made every effort to ensure the accuracy of the contents of this manual. Should any errors be detected, we would greatly appreciate to receive suggestions to improve the quality of the contents of this manual.

The above notwithstanding, we can assume no responsibility for any errors in this manual or their eventual consequences.

We reserve rights to make modifications to this manual without any further notice.

For more detailed technical data about the Beamex® POC8 Automatic Pressure Controller, please contact the manufacturer.

8888500 / POC8uEng / Version 2b

This Warning symbol indicates that danger of injury for persons and the environment and/or considerable damage (mortal danger, danger of injury) will occur if the respective safety precautions are not taken.

This Caution symbol indicates danger for the system and material if the respective safety precautions are not taken.

This Notice symbol does not indicate safety notices but information for a better understanding of the facts.

# Feedback

We want to improve our products and services constantly. Therefore we'd like to know Your opinion of the product You use. Please spend a moment of Your valuable time in filling this form. All respondents will receive a surprise gift in return.

Certain questions can be answered immediately after receiving the product. Others require some use of the product before You are able to answer them. The best way to fill the form is to answer the items as it applies, and send the form to us when all items are answered. There are however no definite restrictions; fill in the form when you feel like it (all items need not be answered). Then send it to Beamex using one of the possibilities listed below.

Mail:Beamex Oy, Ab<br/>Quality Feedback<br/>P.O. Box 5<br/>68601 Pietarsaari<br/>FINLANDFax+358 - 10 - 5505404<br/>Only the next page need to be faxed to us.Internet:https://www.beamex.com<br/>A similar form is available as a web pageE-mail:support@beamex.com<br/>Refer to the numbered items on the next<br/>page in Your e-mail message.

- 1. Name of the product you give feedback of:
- 2. Serial number and software version number (if applicable)
- 3. Any comments when receiving the product. Did the package contain all required items and was it as expected?
- 4. For how long have you been using the product? How helpful was the manual in using the product? 5. (Tick a box in the percentage scale below) 50% 60% 0% 10% 20% 30% 40% 70% 80% 90% 100% 6. How well did the product suit your needs? 0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100% 7. How satisfied are you with the product? 0% 10% 20% 30% 50% 40% 60% 70% 80% 90% 100% 8. Did anything in the product exceed your expectations? In that case, what was it?
- 9. Did anything in the product disappoint you? In that case, please specify.
- 10. Any ideas You want to propose to Beamex so that we can improve our products, operations and/or services.

## **General Information**

### FCC Radio Frequency Emission Notice

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his or her own expense.

Use shielded cables to connect external devices to this instrument to minimize RF radiation.

### Trademarks

Beamex is a registered trade mark of Beamex Oy Ab.

## **Packaging for Shipment**

If the product must be shipped to a different location or returned to Beamex for any reason through a common carrier it must be packaged properly to minimize the risk of damage.

The recommended method of packing is to place the instrument in a container, surrounded on all sides with at least 100 mm / four inches of shock attenuation material such as styrofoam peanuts.

## Safety Notices

### **User Responsibilities**

To ensure safety, the user must make sure that:

- The system is used properly, no dangerous media are used and that all technical specifications are observed.
- The system is operated in perfect operating condition. •
- This operation manual is legible and accessible to the user at the system's location. •
- The system is operated, serviced and repaired only by authorized and gualified personnel.
- The operator receives instruction on industrial safety and environmental protection, and is knowledgeable of the operating instructions and the safety notices contained therein.

## **General Safety Notices**

The system should only be operated by trained personnel who are familiar with this manual and the operation of the instrument.

A condition for trouble-free and safe operation of this system is proper transport, proper storage, installation, assembly and proper use as well as careful operation and maintenance.

Any operation not described in the following instructions should be prohibited. The system must be handled with care required for an electronic precision instrument (protect from humidity, impacts, strong magnetic fields, static electricity and extreme temperatures). Do not insert any objects into the instrument.

The system is powered via the power cable with a voltage that can cause physical injury. Even after disconnecting the system from the power supply, dangerous volt- ages can temporarily occur due to capacitance.

Extreme care must be taken with pressure connections when using hazardous or toxic media.

Repairs must only be performed by authorized service personnel.

Additional safety notices are found throughout this manual.

## **Warnings and Caution Notices**

HIGH PRESSURE! High pressure gases are potentially hazardous. Energy stored in these gases and liquids can be released suddenly and with extreme force. High pressure systems should be assembled and operated only by personnel who have been trained in proper safety practices.

NOT EXPLOSION PROOF! Installation of this instrument in an area requiring devices rated as intrinsically safe is not recommended.

POSSIBLE INJURY! The tubing, valves, and other apparatus attached to the gauge must be adequate for the maximum pressure which will be applied, otherwise physical injury to the operator or bystanders is possible.

USE THE PROPER PRESSURE MEDIUM! Use only clean, dry, non-corrosive gases. This instrument is not designed for oxygen use.

HIGH SOUND LEVELS! Pressures from 70 bar / 1000 psi and up can generate sound levels above 80dbA for brief period when they are exhausted directly to atmosphere. A muffler/ snubber is installed in the vent port. Removal of muffler/ snubber will allow for sound levels to exceed 80dbA.

As with most sensitive electronic equipment, switch the power switch off before connecting or disconnecting to a power source to prevent data loss. Do not position the equipment so that it is difficult to disconnect the power jack.

WARNING: Detachable main power supply cord with inadequate ratings should not be used. See Section 4.0 - Specifications for power ratings.

CAUTION! ESD PROTECTION REQUIRED. The proper use of grounded work surfaces and personal wrist straps are required when coming into contact with exposed circuits (printed circuit boards) to prevent static discharge to sensitive electronic components.

Additional Warning and Caution notices are found throughout this manual.

## **General Description**

POC8 is a bench top or rack mounted Pressure Controller used for test and calibration of mechanical pressure gauges, sensors, transducers, transmitters and any pressure related devices where time to set point is a critical requirement.

POC8 can have up to two highly stable precision pressure measurement modules and an optional barometric module.

POC8 Desk top version.

### Features

- Up to two highly stable, temperature compensated, internal pressure measurement modules.
- Broad operating pressure range from -1 barg / -15 psig to 210 bar / 3 045 psig
- Accuracy 0,02% FS.
- An optional removable / interchangeable internal high accuracy barometric module providing gauge pressure emulation for absolute ranges and absolute pressure emulation for gauge ranges.
- Auto-ranging between the two measurement modules to provide seamless transition between all ranges.
- 7" Color LCD display with touch screen.
- Leak test and burst test.
- Multiple languages; change the language for on-screen text and number/date formats by simply touching one of the "national flag" icons available in the setup screen.
- Desk top or bench mount
- Local Operation, or command and read remotely.

## **Turning On**

Apply power to the power connector on the rear of the instrument with the included power cord, remove any plastic plugs from the rear panel pressure ports, and press the power switch to ON. The system will go through an initialization process, which takes about 30 seconds, and then a display will appear similar to the screen shown below.

Power button highlighted.

#### Earth Ground!

Any power adaptors or surge protection devices that negate the protective earth ground should not be used. The power cord must be accessible and contain a protective earth ground.

#### Ventilation!

Do not block airflow to ventilating fans located on rear of instrument.

To see information about the configuration of your new POC8, touch the Next Page Button [ ] then the Information view icon [ ] on the menu and a window will appear listing the Beamex customer service contact, model number and the modules that are installed. Press the Previous Page Button [ ] then the Home view [ ] to return to the main screen.

Information view button highlighted.

## **Front Panel**

The POC8 front panel includes a 7" color LCD display with touch screen. Operator input is accomplished by pressing the words or symbols and the button icons presented on the display. There is a single discrete on/off button and a USB port on the right hand side.

### **Power Switch**

The power switch is a two-state device with an action similar to that of a ball point pen. Push the button with enough force to latch it in to turn the unit ON. Push it again to release it to turn the system OFF.

If power to the instrument is interrupted while ON it will shut down until the power is restored, then immediately resume operation.

#### **USB** Port

The front panel USB port acts like the Host USB and is intended for software upgrades.

## Display

The display is made up of two sections. In the main screen ("Home view"), the left side shows the operating screen with the control channel. The control channel displays the active pressure reading, units, mode (absolute or gauge), active range of the internal measurement module, pressure control setpoint, a bar graph (if enabled), a zero or tare button (if enabled) and any auxiliary displays that have been chosen. The right side of the screen has button icons for general instrument settings, control settings, display settings, program settings, favorites plus a "Next Page" button [ ] that, when pressed, shows a second and third page of icons for information, troubleshooting, remote communication, step setting, leak test, burst test and service applications.

**Buttons, Labels and Windows:** The touch screen has many buttons with relevant graphic icons or text which, when pressed, will open a related window where changes can be made or information viewed. Some of these buttons will toggle from one state to another, others present choices or display a numerical data entry screen. Text or icons that are displayed, but do not respond to being touched, are called labels or windows. Operators will quickly become accustomed to the particular characteristics of the frequently used buttons.

**Main Screen:** The main screen or "Home view", appears after power-up. This screen contains the operating screen and buttons. It will remain as configured after a power cycle.

**Operating screen:** The operating screen (left side of the screen) contains information relevant to the measurement. Up to three auxiliary displays can be shown simultaneously along with the current pressure value. The operating mode of the instrument can be selected and changed in this screen between "Measure", "Control" and "Vent".

## **Chassis Assembly**

The chassis assembly is the housing for the system. The pressure measurement modules are self-contained inside the chassis and can be replaced using basic hand tools. The picture below shows the top view of the chassis with the cover removed.

Chassis assembly.

The heart of the chassis assembly is referred to as the "Controller Unit". They are available in three variations depending on the working pressure range:

- -1 to 10 barg / -15 to 150 psig
- -1 to 100 barg / -15 to 1 500 psig
- -1 to 210 barg / -15 to 3 045 psig

Each chassis includes platforms for up to two high performance pressure measurement modules, which are traceable to international standards. Both of these modules can be used in conjunction with the highly stable controller unit to produce a precise output. Each measurement module includes its own on-board compensation and calibration data so that any module can be replaced in the instrument without requiring a recalibration.

Pressure Measurement Module.

## **Specifications**

## **Measure Specification**

Specification	POC8
Pressure ranges / Pressure Measurement Modules	Barometric, measuring range: 552 1 172 mbar abs / 8 17 psi abs* ± 350 mbarg / ± 5 psig ± 1 barg / ±14.5 psig -1 to 6 barg / -14.5 to 87 psig -1 to 20 barg / -14.5 to 290 psig -1 to 100 barg / -14.5 to 1 450 psig -1 to 210 barg / -14.5 to 3 045 psig Special range within -1 to 210 bar / -14.5 to 3 045 psi * The barometric module can be used to switch pressure types, absolute <=> gauge. With gauge pressure modules the measuring range of the module must begin with -1 bar / -15 psi in order to carry out a complete absolute pressure emulation.
1 year uncertainty*	<ul> <li>0.02 % of span.</li> <li>For barometric module : 0.02 % of reading</li> <li>* Uncertainty includes reference standard uncertainty, hysteresis, nonlinearity, repeatability and typical long term stability for mentioned period (k=2).</li> </ul>
Pressure types	Absolute and gauge or bi-directional ranges
Recommended Calibration Interval	365 days
Reading rate	33 readings/second
Wetted Parts	Aluminum, Brass,316 and 316L stainless steel, Buna N, FKM/FPM, PCTFE, PEEK, PTFE, PPS, PAI, Glass-filled Epoxy, RTV, Silicone, Silicone grease, Ure-thane

## **Control Specifications**

Specification	POC8	
External Source Requirements	10% over range or 1.38 bar / 20 psi over the highest measurement module,	
	whichever is less:	
	min. 0.34 bar / 5 psig	
	max. 211 bar / 3 060 psig	
External Exhaust Requirements	Vacuum source required for sub atmospheric control	
Stability of Controlled Pressure	0.005% of full scale of the active range, typically better than 0.002% of span af-	
	ter 10 sec after displaying stable pressure	
Minimum Control Pressure	0.05% FS or 1.72 mbar / 0.025 psi over exhaust pressure,	
	whichever is greater	
Maximum Control Pressure	Available Controller Units (one of the listed pre-installed inside the unit):	
	-1 to 10 barg / -15 to 150 psig	
	-1 to 100 barg / -15 to 1 500 psig	
	-1 to 210 barg / -15 to 3 045 psig	
Pressure Control Modes	Fast, medium, slow and variable	
Pressure Control Rates	0.05% FS/sec to 10% FS/sec into a 50 ml volume	
Stability of Rate Control	+/- 10% of rate setpoint, down to +/- 0.001% of span of active range per sec	
Control Time	10 s (regarding a 10% FS pressure increase in a 50 ml test volume)	
Overshoot	< 0.3% FS in fast control mode (typical < 0.01% FS in slow control mode)	
Supply Consumption	< 70.8 I / < 2.5 standard cubic feet per hour in steady-state control	
Test Volume	0 to 1000 ml; The controller auto compensates volumes from 0 to 500 ml	

## **General Specifications**

Specification	POC8	
Instrument Version	Standard: desktop case	
	Optional: bench mounting kit	
Dimensions	See technical drawings	
Weight	Approximately 12.7 Kg / 28 lbs. with all internal options (desktop case)	
Warm up Time	Approximately 15 minutes	
Screen	7" color LCD display, resistive touchscreen	
Resolution	4 6 digits depending on range and units	
Pressure units: Metric	Metric: mbar, bar, Pascal, hPa, kPa, MPa, mmH2O@4°C, cmH2O@4°C, mH2O@4°C, mmH2O@ 20°C, cmH2O@20°C, mH2O@20°C, mSV, mmHg@0°C, cmHg@0°C, mHg@0°C, Torr, mTorr, Dyn/cm2, g/cm2, kg/cm2 Imperial: psi, inHg@0°C, inHg@60°F, inH2O@0°C, inH2O@20°C, inH2O@60°F, ftH2O@4°C, ftH2O@20°C, ftH2O@60°F, inSW. Osi, psf, tsi tsf, ftSW, Torr,	
Description of the second second	mTorr, % of range, atm	
Pressure units user defined	2 (multiplier from psi or Pascal)	
Languages	English, French, German, Italian, Spanish, Polish, Portuguese, Russian, Chi- nese, Japanese, Korean	
Measurement Filters	Off, Low, Normal (default), High	
Pressure ports	4 ports with 7/16"- 20 F UNF including adapters to Beamex low/high pressure hoses (vacuum and pressure supply hoses are included) Optional Barometer: 10-32 UNF female port	
Filter Elements	Filter element (40 micron) included in each pressure port	
Permissible Pressure Media	Clean dry non-corrosive gases (ISO8573-1:2010 Class 5.5.4 or better)	
Overpressure Protection	Safety relief valves are set to protect each internal pressure module	
Power Supply	100 – 120 or 200 - 240 VAC, 50 Hz / 60 Hz, 120 VA Max	
Storage Temperature	0 70 °C / 32 158 °F	
Operating Temperature / Compensated	15 45 °C / 59 113 °F	
Temperature Range		
Humidity	5 95 % r. h. (relative humidity, non-condensing)	
Mounting Position	Horizontal	
Digital Interface	Standard: Ethernet, IEEE-488, USB, RS-232. Only the USB interface is supported with Beamex products.	
Response Time	100 ms	
EU Declaration (CE mark)	Conformity certificate	
Calibration	Accredited Calibration Certificate included	

This is class A equipment for emissions and is intended for use in industrial environments. In other environments, e.g. residential or commercial installations, it can interfere with other equipment under certain conditions. In such circumstances the operator is expected to take the appropriate measures.

## Installation

**READ THESE INSTRUCTIONS BEFORE INSTALLATION!** 

## **Unpacking the Instrument**

In addition to functional testing, each unit is inspected for appearance prior to leaving the factory. Upon receipt, please examine the instrument for shipping damage. Report any apparent damage to the carrier immediately.

The following items are included in the standard delivery:

- POC8 Automatic Pressure Controller
- Calibration certificate
- This User Guide
- Power Cord
- Vacuum connection hose and connectors
- Supply pressure connection hose and connectors

## **Dimensions in mm / inches**

Front view, standalone instrument.

Side view, standalone instrument.

Front view, rack mounted instrument.

Beamex® POC8 Automatic Pressure Controller

## Mounting

The instrument can be set up on a desk top or it can be rack-mounted. Rack mount hardware is optional on the POC8 (see chapter **Dimensions in mm / inches** on page 12 and **Options** on page 69).

The measurement modules are relatively insensitive to tilt and vibration. However to further assure stability and accuracy, avoid mounting the instrument on surfaces subject to excessive motor or machinery vibration.

## **Rear Panel**

Five pneumatic pressure ports are located across the rear panel. Any instrument containing sub-atmospheric pressure ranges needs a vacuum pump to be connected at the exhaust port. The instruments with pressures above or at atmospheric pressures will have the exhaust port open. Next to the ventilation fan is a 10-32 UNF fitting which is connected to the barometric module if installed. Positioned on the right side is a remote communication connections; RS-232, Ethernet, IEEE- 488, USB along with the USB host connection.

Rear Panel.

#### **Pressure Connections**

The pressure connections must be installed according to the following instructions, observing the relevant regulations. The installation is to be performed by trained, authorized personnel, knowledgeable in the safety regulations for working on pneumatic/hydraulic systems.

Five pressure connections are on the rear panel. Plugged connections are not used.

All pressure ports on the rear apart from the Vent Port are female 7/16" - 20 F UNF. Beamex provides pressure connectors and vacuum and supply hoses with the device. Pressure hoses for output pressure are optional accessories. Do not use sealant on fittings sealed with an o-ring. The integrity of each seal is particularly important since even microscopic leaks can cause errors in pressure measurements.

#### **Supply Port**

The pressure supplied to the pressure connection labeled "Supply" should be approximately 10% higher than the full scale of the highest pressure transducer installed in the controller (see chapter **Contact and Version Information View** on page 16).

#### **Exhaust Port**

The pressure connection labelled "Exhaust" is for the vacuum supply. In a gauge pressure version it can be left open to atmospheric pressure.

#### Vent Port

The pressure connection labelled "Vent" is the exhaust port where the system pressure is vented to the atmosphere under certain conditions. This port has a breather vent installed that acts like a muffler. Leave this port open.

#### **Measure/Control Port**

The Measure/ Control port (when in the Control mode) supplies pressure that is precisely controlled by the controller. In the Measure mode a pressure applied to the Measure/Control port is measured by the internal measurement modules.

#### **Reference Port**

The pressure connection labeled "Reference" is the reference port, it is available to connect to the reference side of the sensor. This port is normally left open to atmosphere but may be connected to a stable reference pressure. For an absolute pressure measurement module this port can be plugged.

#### **Barometric Reference Port**

The Barometric Reference port is connected to the optional internal barometer module and should be left open to atmospheric pressure.

#### **Remote Communication Connections**

See chapter **Remote Operation** on page 49 for connections and commands for operation over IEEE-488, Ethernet, USB or RS-232 ports.

#### **Power Up**

Apply power to the power connector on the rear of the instrument using the power cord included, and switch the power switch on the front of the unit ON. The instrument will go through an initialization process and system check. As soon as the system check is completed the system will default to a screen similar to the one shown in chapter **Display Screen Features** on page 15. The main screen may be configured in many different ways but initially it will be in a default configuration. Subsequently, the unit will power up in the configuration that it was in when last powered off. Allow at least 15 minutes of warm up before performing critical pressure measurements.

## **Local Operation and Setup**

## **General Operation**

This section describes the procedures for operating the POC8 from the front panel. Instructions for operating the device remotely from an external computer are covered in **Remote Operation** on page 49. By following the procedures provided in these two chapters and chapter **Calibra-tion** on page 75, you can expect your POC8 to deliver maximum accuracy and dependability for many years of useful service.

#### Setup

Configuration is achieved by changing settings accessed through the buttons on the right. Local operation is accomplished by observing the data presented in the display. The appearance and functionality of the display can be changed by pressing corresponding button for the related function. After a button/function has been chosen, a set of related parameters will appear. After choosing one of these parameters, a set of selections related to that parameter will appear or a data entry keypad. The desired selection or data can be entered here.

#### **Display Screen Features**

The screen shown below provides an overview of the features shown on the display after initialization. The left side of the display contains the area where information is displayed (in this case the Home view) and the right side contains the buttons for settings and other functions. A zero or tare button, bar graph and auxiliary displays (rate set point, control rate, peak values & units) will appear in the Home view, if activated. All of the screen features are described in more detail throughout this manual. The active button is represented in a lighter gray color as compared to the other buttons.

Operating Screen

Buttons

Display Screen Features.

## **Initial Setup**

Chapters **Contact and Version Information View** and **Language Selection** further down on this page are provided first so that the operator can initially check the information screen to verify the installed components and to change the language if needed.

### **Contact and Version Information View**

Navigate to the view selection area by pressing the Next Page button [ ] at the right bottom under the buttons on the right. This gives access to the second page of the button selection area. Press the Information view button [ ] to display Beamex contact, installed pressure control unit and pressure measurement modules along with instrument and software version information.

### **Settings Views' Parameter Inputs**

The Settings view's input area on the right one fourth of the screen (see chapter **Display Screen Features** on page 15) is the area where setup, information, calibration, service and other functions can be chosen. Multiple pages of selections can be accessed by pressing the Next Page button [ ] or by pressing the Previous Page button [ ] ]. A series of horizontally placed circles on the bottom right represents the number of pages and indicate the active page by a larger circle. As a function is chosen, related parameters will appear on the left side of the screen along with the name of the function, and a reduced size icon in the top title section. When a parameter is chosen, related selections, sliding scales or a data entry key pad will appear in the input area on the right where the buttons were previously displayed. An example of each type of input is shown below. To return to the main view's buttons, simply press the Menu button [ ]] above the input area. The purpose and use of each selection and menu is intuitively apparent and will become second nature with minimal exposure to the menu structure.

Settings Views.

## **Main Functions**

#### **Home View**

The Home view [ ] is the normal operation screen. This view is different from the others in that it is not used to setup the configuration but is used to monitor the pressure applied to the installed measurement modules and the device under test through the measure / control port.

The "Home view" picture shows the basic Home view in an instrument. The user can change the display to show multiple auxiliary displays by pressing the auxiliary button on the left corner of the screen ("Single channel display" picture). The Units button is always displayed. When the Units button is pressed a selection of imperial and metric units will be displayed on the right ("Pressure units" picture); notice that the Units button has a lighter background when the selection menu is active. If a barometric reference is installed, the Mode button, described below, will toggle from Gauge to Absolute mode when pressed.

Home view.

Single channel display.

Pressure units.

#### Range Hold / Autorange

The Range Hold / Autorange button allows the user to select the active range. By clicking the Range Hold button, the user can select the active measurement module from the primary and secondary modules or utilize the "Autorange" feature to let the instrument automatically select the active range based on the current pressure value.

Range Hold button highlighted.

#### **Control Setpoint**

The Setpoint button allows the user to enter the desired pressure value to be controlled by the POC8. There are multiple ways of entering the control setpoint; numeric keypad, step increments, percentage entry, digital step or a program data entry. These methods can be accessed by the user by pressing the "Setpoint" button and the various setpoint entry methods can be navigated with the Next Page [

Setpoint button highlighted.

#### **Numeric Keypad**

The first entry method provides 10 digits for numeric entry, plus the decimal point and a sign key (see picture below). The sign key [+/-] will toggle between positive and negative values. Each stroke on the key pad will echo in the blue input value window above the pad. A change between plus and minus values [+/-] can be entered at any time during the string entry. Pressing the Enter [

If the input window holds an illegal value when the Enter button is pressed the system will respond with an error tone and the entry will turn red. When that happens determine the cause of rejection, delete the entry using the Delete [ ] button and then enter a valid number. The setpoint can only be entered within the minimum and maximum control range set in chapter **Control Limits** on page 33. These limits are shown above the numeric entry keypad.

🎢 Home				II Set	point	
Range Hold -1.000 210.000	)		Setpoint 0.000	↓ -1.00¢	0 2	10.000↑
				1	2	3

		bar Ga	auge	+/-	0	•
+				<	+	×
+						
Measure	Control		Vent		••••	

Numeric Keypad Setpoint Entry. Min. & Max. setpoint values highlighted.

#### **Step Increments**

The second entry method allows the user to enter the setpoint in the same way as the Numeric Keypad by keying in the value and then pressing the Enter [ ] ] button. The user can then enter the desired value of step increment and press the Step Up [ ] ] or Step Down [ ] ] button, without pressing the Enter button. This number will then be used to decrease or increase the existing setpoint value. Subsequent touches of the Step Up or Step Down button will continue to increase or decrease the setpoint by the step value. If the Enter button is pressed the newly entered value will register as a new setpoint value on the Home Screen rather than a step value.

Numeric Keypad Setpoint Entry. Step increment buttons highlighted.

#### **Percentage Entry**

The third entry method is the Percentage Entry method (see leftmost picture below) which allows the user to select a setpoint value as a percentage of the pressure range of device under test (DUT). The user can choose between various percentage values by clicking on the desired button. The setpoint will instantly change to the selected percentage value of the DUT. The user can also configure the minimum and maximum pressure values of the DUT by clicking the button displaying pressure range. This would take the user to the Step Settings view (see rightmost picture below) which is explained in section Step Settings.

Step Settings		ii Setpo	int %	Step Settings			ii Maximum Ra		Range
Device Under Test Maximum Range	210.000 bar	-1.000. bar	210.000 %	Device Under Te	est Maximum Range	210.000 bar	↓ -1.00	0 (2	10.000†

Preset Steps 0 %	10 %	•	•••	Preset Steps	0 %	10 % 🗸			

Percentage Entry window.

Entering maximum range.

#### **Digital Step Entry**

The fourth entry method is the Digital Step data entry method. This method allows the user to increase or decrease the setpoint value by one digit at a time. The digit to be changed can be selected from a string of five zeroes (0) and one green numeral one (1) by sliding a finger across the zeroes and converting the desired digit to a green 1. The right most digit in the Digital Step corresponds to the least significant digit of the setpoint. Each digit of the setpoint can then be increased or decreased by pressing the Up [

Digital Step Entry.

#### **Program Data Entry**

The fifth entry method is through the automated Programs stored in the memory. The Program Player allows the user to select one of the stored Programs and use it for setpoint entry. A Program can be chosen by using the Up [ ] or Down [ ] buttons. After selecting the desired program, press the Play [ ] button to start the program. More information on the Program Player and how to create/ edit programs is available in chapter **Programs** on page 37.

Program Data Entry.

#### **Units and Pressure Type**

The Units button is always displayed. When the Units button is pressed a selection of imperial and metric units will be displayed on the right (rightmost picture below). The pressure Type button is only active if there is an optional barometer module installed. Otherwise, the Type button becomes a label (leftmost picture below) indicating the native pressure type of the channel (absolute or gauge). When an optional barometer module is installed, a native gauge module can emulate absolute pressure using the barometric reference. Alternatively, a native absolute module can emulate gauge pressure. Emulation can be activated simply by pressing the pressure Type button.

No barometric module.

#### **Bar Graph**

An optional bar graph can be displayed below the current pressure value. The bar graph indicates the position of the current value with the maximum range of the primary measurement module in that channel. This bar graph will appear in the Home view when selected from the **Display Settings** presented on page 35.

#### **Auxiliary Displays**

The screen in the uppermost picture below shows all of the possible auxiliary display items that can be included in the Home view. The Home view can have up to three auxiliary displays which can be chosen by clicking on each button and then selecting the display item from the menu on the right side of the screen (the lowermost picture below).

Home view with auxiliary displays.

😭 Home			ii Auxiliary Display
Range Hold		Setpoint	None
-1.000 210.00	DO	0.000	Peak
			Rate
		,000	Rate Setpoint
	- 0 -		Uncertainty
		bar Gauge	Units
+			Barometer
+			
+			
Measure	Control	Vent	

Auxiliary display selection.

Each auxiliary display can be modified by pressing the displayed button.

Peak: Pressing the Peak button will reset the upper and lower peak value to the current reading, subsequent negative or positive divergence from that reading will be recorded in the button.

Rate: Pressing the Rate button will display a choice of time rate units for the rate denominator.

Rate Setpoint: Pressing the Rate Setpoint button will let the user enter the new Rate Setpoint via multiple entry methods.

Units: Pressing the Auxiliary Units button will display the same set of units available for the primary units. Pressing any of these units will change the auxiliary units to that chosen unit.

#### Zero Button

If the Zero Calibration function has been chosen in the **Display Settings** presented on page 35, then the Zero Cal Button [ ] will appear in the Home view. If the instrument is measuring absolute pressure, and the Zero Cal Button is pressed, a keyboard will appear to allow a single point calibration. If the instrument is measuring gauge pressure, pressing the button will set the current reading to zero. If the instrument is in emulation mode (absolute or gauge) then the value will not be saved to the sensor but only as a temporary adjustment while in emulation mode. After exiting the emulation mode or after a power cycle, the temporary adjustment will be cleared. The zero adjustment not in emulation mode will be saved to the sensor as if single point calibration had been performed.

The pictures below show the instrument with zero cal function enabled. The picture on the left shows instrument in gauge mode. The picture on the right shows the same instrument, but the zero button on the absolute mode has been pressed, showing the keypad enabled to accept a new single point calibration value.

Gauge pressure, zeroing.

Absolute pressure, zeroing.

The background color of the zero button will momentarily change to a lighter color as the zero calibration is performed then will revert back to a darker color when complete.

#### Tare Button

If the Tare calibration function has been chosen in the **Display Settings** presented on page 35, then the Tare Button [ ] ] will appear in the channel screen. The Tare button and the Zero Button cannot appear on the screen at the same time, in the same channel. When the Tare button is pressed, the instrument will subtract the current pressure reading (the tare pressure) so that the indicator will display zero. Subsequent deviations in pressure will be relative to the tare pressure.

Tare button.

Pressing the tare button again will deactivate the tare and change the pressure indication back to the reading corresponding to the calibrated output of the measurement module. An active tare will revert to a deactivated state after a power cycle.

#### **Operating Mode Selection**

The operating modes are permanently displayed on bottom of the Home view. There are three operating modes: Measure, Control and Vent. After the system has switched on, the instrument will automatically be placed in Vent mode. The user can switch from one mode to the other by using the mode selection keys.

When switching from Control mode to Measure mode, the system will not be vented and the last applied pressure will be locked in the system by means of a solenoid valve.

**Measure Mode:** In Measure mode the device acts like a precision pressure measuring instrument and measures the pressure applied at the Measure/Control port. If the Control mode was the last used mode before switching into Measure mode, the last controlled pressure is held in the test assembly.

**Control Mode:** In Control mode the device provides a controlled pressure at the Measure/Control port equal to the setpoint value. It is activated by pressing the Control button. In order to ensure smooth operation in the control mode, following measures must be taken and respective parameters must be set.

- In order to control pressures close to or below atmospheric pressure, a vacuum pump should be connected to the Exhaust port.
- The control speed can be set in the Control Settings view [ ]. The Control rate can be set between 0.001% of range/sec to 20% of range/sec.
- Control limits can be set in the Control Settings view [

**Vent Mode**: The Vent function will vent the system to the atmosphere, including the test assembly connected to the Measure/ Control port. The Vent mode can be activated from the Measure or Control mode by pressing the Vent button. The vent rate can be set in the Control Settings view [ ] The vent rate can be set between 0.001% of range/sec to 20% of range/sec.

Venting will cause a loss of pressure at the vent rate in the system and the plumbing connected to the measure control port. Care must be taken that the device under test is not damaged during venting.

#### **Settings View**

The Settings view [ ] is used to set up general settings for the display. Settings parameters include Language, Brightness, Volume, User 1 base units, User 1 multiplier, User 2 base units, User 2 multiplier, Barometer units, and Configuration. The picture below shows these parameters as indicated when the Settings view has been chosen. As each parameter is pressed, an input screen will appear on the right where selections can be made.

The Settings view provides a place to change the language, display brightness, volume, user units, and barometer units. Configuration settings of the unit can also be saved in this view plus the default configuration can be activated.

🆏 Settings			Menu	1		
Language	English (US)		~		*	
Brightness	80%	1				<u>ě</u> t
Volume	Off					
User 1 base units	bar		ō	т	<b>_</b> _	<u>.</u>

Barometer Units	bar					
		1.0	1545 k	barA		
Configuration						

Settings view.

#### Language

The Language setting provides a selection of different languages. Once a language is chosen all words within all menus will appear in the chosen language and the radix character (decimal mark) will change from a dot (.) to a comma (,) depending on the language chosen. More languages can be accessed by navigating to the next page of the language selection menu on the right side of the screen.

🎭 Settings	ii English (US)

User 1 multiplier	x 1.000000 Polish (PL)
User 2 base units	bar 🚺 Portuguese (PT)
User 2 multiplier	x 1.000000 📀 Portuguese (BR)
Barometer Units	bar 🔤 Russian (RU)
Configuration	<ul> <li>•</li> <li>•</li> </ul>

Languages.

#### **Brightness**

The Brightness setting provides a sliding scale to increment the screen brightness in all screens. Sliding your finger along the bar graph or touching anywhere in the bar graph will change the brightness of the screen. After the setting is made and your finger is removed from the screen the menu will show the brightness percent selected.

🏘 Settings		 Brightness

Configuration			

Volume.

#### User base units / Base units multiplier

When choosing a unit of measure from the Home view (main screen), standard units can be chosen in addition to two user defined units. User units 1 and 2 are defined in the Settings View using "User 1 base units", "User 1 multiplier" and / or "User 2 base units", "User 2 multiplier". For example, if the display of one atmosphere (atm) was needed, then psi could be chosen as the "User 1 base unit" and the "User 1 multiplier", in this case, would be 0.068045. When set this way and the user 1 unit has been chosen, the user 1 unit will now display the pressure in atm.

🏘 Settings		II Us	er 1 mul	tiplier

Configuration			•		

Barometer units.

#### Configuration

Configuration is the last parameter in the Settings view. It allows the operator to save instrument settings and load them, as needed, in the future. Parameters that are set in the Settings view, the Frames view, the Transducer view, and the Remote view can be saved using the Configuration "Save" button and recalled using the Configuration "Load" button. Simply set all desired parameters then go to Settings-Configuration, press one of the numbered Configuration buttons then press the "Save" button. This will save the current configuration in that button. To reload a saved configuration at a later time, go to Settings-Configuration and press the "Load" button.

🏘 Settings		<b>II</b> Configuration

User 2 multiplier	x 1.000000	
Barometer Units	bar	Save
Configuration		Default

Configuration.

The instrument default configuration can be activated simply by pressing the "Default" Button.

### **Control Settings**

The Control Settings view [ ] allows the user to select and configure the control parameters for the solenoid valve controller in the instrument. This display remains the same for either one or two pressure modules. The Control Settings screen is divided into two pages and can be navigated using the Next Page [ ] and Previous Page [ ] buttons. The Control Settings view provides two preset control modes "Precision" and "High Speed" which affect the "Control Behavior", "Rate Setpoint", "Stable Limits" and "Stable Delay". The Precision control mode is set as default and provides a stable control rate at medium overshoots. The High Speed control mode provides faster control rate at a higher overshoot. Each of the control parameters can be changed by the user to best suit their application in the "Custom" control mode. The "Custom" control mode retains the values of the parameters entered by the user until the user changes it again. The first two pictures below show the Control Settings view. The lowermost picture shows the first page of the Control Settings view in "High-Speed" control modes.

Control Settings		🔢 Menu		Control Settings		🔢 Menu	
			**	Maximum Limit	210.002 ba		**
			¢ <sub>⊕</sub>	Minimum Limit	-1.002 bai		¢.

High Speed control mode.

#### **Control Behavior**

The Control Behavior button in the Control Settings view provides a choice between different levels of control behavior ranging from "0" to "100" where "0" represents lowest overshoot control mode and "100" represents High Speed control mode. The Control Behavior is preset to "50" for Precision control mode and to "100" for High Speed control mode. The Control Behavior can be changed using the sliding scale. This will change the control mode to "Custom". The picture level shows the sliding bar to adjust control behavior.

Control Settings		 Control Behavior
		High Speed

Rate Setpoint	21.10 bar/Sec	
Stable Window	0.005%	
Stable Delay	3.0 Seconds	
Control Volume	Auto	
Precision High Speed	Custom	
••		Low Overshoot

Control Limit Setting.

#### **Rate Setpoint**

The Rate Setpoint button allows the user to set the rate of pressure change when the device is controlling up or down to a setpoint (picture below). The rate is limited to 0.001% of span of active range of the measurement module/second to 20% of the full scale range/second.

Control Settings		II Rat	te Setpo	oint
		↓ 0.00	D	<b>42.2</b> 0↑

Rate Setpoint	21.10 bar/Sec	4	5	6
Stable Window	0.005%	7	8	9
Stable Delay	3.0 Seconds		0	· ·
Control Volume Precision High Speed	Auto Custom		÷	×
Ingli speed	Custom			
••				

Rate Setpoint.

#### **Stability Parameters**

Stability parameters for the controlled pressure can be found in the Control Settings view and can be configured using the Stable Window and Stable Delay buttons. When the controller enters a stable condition the pressure indication color on the Home view will change from white to green. The Stable Window button allows the user to enter a value as a percentage of the highest range pressure module. This value represents the pressure window within which any set-point value would be considered stable by the user. The Stable Delay button lets the user add a desired delay until the pressure value is considered stable while being in the stable window.

Stability parameters highlighted.

#### **Control Volume**

The Control Volume button in the Control Settings view allows the user to control pressure volume in "cc". The device is capable of automatically identifying the control pressure volume and adjusting the control parameters based on it. By default this button is set on "Auto". The picture below displays the control volume setting for the instrument.

Control Settings	II Co	ntrol Vo	lume	
		10	2	000 cc↑
Control Behavior	50	1	2	3
Rate Setpoint	21.10 bar/Sec	4	5	6
Stable Window	0.005%	7	8	9
Stable Delay	3.0 Seconds		0	
Control Volume	Auto		_	
Precision High Speed	Custom	~	÷	×
••			ļ	Auto

Control Volume.

#### **Control Limits**

The Maximum and Minimum Limit buttons can be accessed by clicking the Next Page [ ] button in the Control Settings view. These buttons provide a place to limit the setpoint value that can be chosen in the Home view. These limits can only be set within the range of the active pressure module. When the instrument is in Autorange the limits can only be set within the range of the primary pressure module which, by convention, will have the widest range. The minimum limit must be lower than the maximum limit. The user can not enter setpoints and thereby not control to pressures outside of these limits.

Control limits.

#### Vent Rate

The Vent Rate button in the Control Settings view lets the user to determine the rate at which pressure will vent in vent mode. By default the rate of the vent is set similar to the control rate. The rate is limited to a maximum of 20% of the full scale range/ second. The picture below displays the vent rate setting for the instrument.

Control Settings		ii F	Rate	
Maximum Limit	210.002 bar			
Minimum Limit	-1.002 bar	↓ 0	.00	42.20↑
Vent Rate	21.10 bar/Sec	1	2	3

Rate Stable Delay	5.0 Seconds	7	8	9
Supply Detection	On		0	
Burst Detection	On			<u> </u>
Measure Regulation	Off	<b>√</b>	+	×
••				

Vent rate.

#### **Rate Parameters**

Rate parameters for the control rate can be found in the Control Settings view and can be configured using the Rate Stable Window and Rate Stable Delay buttons. The Rate Stable Window button allows the user to enter a value as a percentage of the active range of pressure module. This value represents the pressure window within which the control rate value would be considered stable by the user. The Rate Stable Delay button lets the user add a desired delay until the control rate is considered stable while being in the rate stable window.

#### **Detection Flags**

POC8 is equipped with three detection flags that can be enabled or disabled by the user as needed. These detection flags appear in the Control Settings view. The primary purpose of these detection flags is to protect the device and to ensure desired operation. Each of these flags can be turned "On" or "Off" as per user's need. The picture below shows the detection flag settings.

**Supply Detection**: If turned "On", this flag allows the user to check for sufficient supply pressure at the Supply Port of the instrument. In case the supply pressure is less than over 10% of the control setpoint, an error is reported which can be seen in the Troubleshoot view by clicking the error symbol [

**Burst Detection**: If turned "On", this flag allows the user to protect the instrument against sudden bursts in the pressure at the Measure/ Control Port. In case a burst is detected, an error is reported which can be seen in the Troubleshoot view. This flag is turned "Off" by default.

**Measure Regulation**: If turned "On", this flag allows pressure to be controlled while the instrument is in "Measure" mode to prevent pressure leaks in the system over time. This will turn on the internal pressure controller periodically to control pressure in a certain range of the measured pressure value. This flag is turned "Off" by default.

### **Display Settings**

The Display Settings view [ ] allows the user to configure display properties like the filter for the reading to reduce fluctuations due to electrical noise, and to set the resolution of the reading. In addition, the bar graph display and calibration function can be specified here.

Display Settings.

#### **Reading Filter**

The Filter is an electronic filter to smooth out the pressure readings. Because of differences in resolution, greater filtering may display a more stable reading for some pressure units. Turn off the Filter by selecting "Off", select varying degrees of filtering for the current units by selecting "Low", "Normal" or "High".

💐 Display Settings		ii Filter
		Off
		Low
Filter	Normal	Normal
Resolution	6	High

### Programs

The Programs view [ ] is used to create, view and edit programs that are used to automatically run a sequence of commands within the device. The Programs view screen displays the contents of the first written program in read only mode by default (leftmost picture below). User can load, edit and delete other saved programs by clicking on the title of the current program and then selecting the desired program sequence from the sidebar (rightmost picture below).

Programs view.

Load, edit or delete programs.

#### **Edit Programs**

By default the programs are available in read only mode to prevent accidental changes to existing programs. The users can edit existing programs or create steps in new ones by clicking on Edit Program [ ] button (leftmost picture below). This makes the program editable and also activates the Insert [ ] and Delete [ ] ] buttons which are otherwise just labels and can't be clicked by the user. A series of predefined commands can be chosen to write the steps of a program. Selection of commands and data in each sequential line will create a draft of resulting command sequence in the selected program (rightmost picture below). Upon exiting the edit mode by pressing the Edit Program [ ] button, the system will ask "Save changed programs?" Pressing the [ ] button will accept the changes, pressing the [ ] will revert back to the old program. A list of available commands, data values and their functions are listed in the table on next page.

Prog	grams		ii Command	∭_	Programs		ii Command
TEST	TEST		A TEST		ST	А	
01	UNITS	PSI	RANGE	01			RANGE
02	SETPOINT	1	WAIT	02	UNITS	PSI	WAIT

	<b>X</b>		•• •		<b>≡∕ \</b> +\ ×		•• •

Editable programs view.

New line creation.

Command	Function (data selection)
UNIT	Sets the pressure unit for operation
DELAY	Delays for time = 1 to 3600 seconds (Numerical Entry
MODE	Sets the control mode (Measure, Control or Vent)
PTYPE	Sets the pressure type (Gauge or Absolute)
RSETPT	Sets the rate setpoint in current units (Numerical Entry)
RUNITS	Sets the rate denominator time unit (min or sec)
SENSOR	Sets the active measurement module (1, 2 or 3)
SEQSTART	Starts the sequence from the beginning (None)
SETPOINT	Sets the control setpoint for the instrument (Numerical Entry)
SETPOINT%	Sets the control setpoint in % of current range (Numerical Entry)
WAIT	Waits for a manual input or stable condition (Stable or Input)

#### Table – Sequence Commands

### **Favorites View**

The Favorites view is used to select programs that will appear in the Home view when the Favorites [ 🛃 ] is pressed. The purpose of the Favorites view is to provide quick access to frequently used programs. The current list of favorites is shown in leftmost picture below. The desired program can be selected by clicking on its name which takes the user to the Programs view where the program can run be by clicking on the Play [ ▶ ] button. A maximum of eight programs can be stored as favorites.

Favorites view.

Play button highlighted.

### **Information View**

The Information view [ 0 ] displays information about the device, including:

- Beamex address, and email
- Model number, serial number and operating software version.
- Control unit, serial number and software version.
- Pressure measurement module(s), range, serial number, and software version.

Information		ii Menu	
Beamex Oy Ab Ristisuonraitti 10 FIN-68600 Pietarsaari FINLAND info@beamex.com	Model: POC8 S/N: 41000ECV Version: 2.34.9 OS Ver: 1.2

Information view.

### **Troubleshooting View**

The Troubleshoot view [  $\bigwedge$  ] can be found by navigating to the second page of buttons on the left. It is done by clicking on the Next Page [  $\bigotimes$  ] button. The Troubleshoot view will display information about error conditions and remote communications. Within the troubleshoot screen (leftmost picture below), push the Error button to display any errors that have occurred in the instrument due to a communication or network error. Push the Remote Settings button (rightmost picture below) to show commands and responses that have been sent over the remote communication connection. If there are any errors in the error queue an error symbol [  $\bigwedge$  ] will appear in all screens (lowermost picture below). Pressing this error button from any screen will open the Troubleshoot view where the error can be viewed.

Troubleshoot error view.

Troubleshoot remote view.

Error indication.

### **Remote Settings View**

With the Remote Settings view [ ] user can select the remote command set for all interfaces. The GPIB address (IEEE-488), and Serial parameters (Serial RS-232 or USB) can be set on the first page and Ethernet network parameters on the second. Details about the Remote Operation (command sets, cable requirements, etc.) can be found in chapter **Remote Operation** on page 49.

Remote Settings view, page 1.

Remote Settings view, page 2.

#### **Remote Command Set**

The remote command set parameter provides a choice of the Beamex, SCPI or DPI5xx command set. The Beamex commands are listed in chapter **Remote Operation** on page 49.

🖙 🗄 Remote		ii Command Set
Command Set	Beamex	Beamex
GPIB Address	1	SCPI
		DPI5xx
Baud	57600	
Serial Format	8/1/None	
Echo	Off	
Checksum	Off	
Termination Character	CR	
	•	

Remote Command Sets.

#### **Remote Communication Settings**

The remainder of the Parameters in the Remote view present the choice of a numeric entry, a numeric address entry, or a radio button selection. The parameters that require a numeric entry will present a numeric keypad with min and max limits for the variable. The parameters that require a numeric address (for example an IP address) will also present a keypad. Address entries should conform to the format of the parameter selected. The three screens below show examples of each type.

🖙 a Remote		:: c	GPIB Addro	ess
Command Set	РОСВ			
GPIB Address	1	↓1	_	31↑
		1	2	3
Baud	57600	4	5	6
Serial Format	8/1/None	7	8	9
Echo	Off		0	
Checksum	Off			
Termination Character	LF	~	+	×

GPIB Address, numeric entry field highlighted.

🖵 🗄 Remote			IP Addr	ess		⊡≞ R	emote				DHCP
IP Address	10.10.10.20					IP A	ddress		10.10.10.20	On	
Netmask	255.255.255.0	-				Netr	nask		255.255.255.0	Off	
Gateway	10.10.10.1	1	. 2	2	3	Gate	way		10.10.10.1		
Port	49405	4	5	5	6	Port			49405		
DHCP	Off	7	8	3	9	DHC	Р		Off		
			C		•						
		~	∕	-	×						
••								••			

IP Address.

Setting the Ethernet DHCP to yes will have a short delay while the DHCP server is contacted. If a DHCP server is not found, an error will be indicated. If DHCP is enabled, the IP address, Netmask and Gateway are greyed out and locked, these are controlled by the DHCP server.

A successful communication link between the instrument and the various interfaces is indicated by a Remote Settings Icon [ 🔤 ] at the top of the screen.

### **Step Settings View**

The Step Settings view [ ] ] allows the user to enter control setpoint value or write program sequences as a factor of the percentage of the device under test operating pressure range or as fixed pressure values (uppermost picture below). The user can enter the minimum and maximum range of the device under test (two middlemost pictures) and then select the desired percentage value(s) or desired fixed pressure value(s) for setpoint(s). These ranges should be within the maximum range of the primary pressure measurement module. The user can also enter the control point up to a maximum of 5% over the range of the device under test limits by entering the overrange percentage (lowermost picture below). POC8 automatically calculates the pressure value of the setpoint based on this selection. The user can be directed to this view from the setpoint entry menu in chapter **Home View** on page 18.

Step settings view.

Overrange Selection.

#### **Preset Steps**

The user can have up to 12 different points along the range of the device under test (DUT). The Preset Steps button allows the user to enter the number of points and then automatically divides the range in equivalent percentages. For example if the user needs 6 distinct points along the DUT range then enter 6 in the numeric keypad and press Enter [ ] ] button. POC8 will create setpoints at 0%, 20%, 40%, 60%, 80% and 100% of the DUT range. The user also has the option of changing these percentage values by clicking on the individual Percentage button on the Step Settings view. The user can enter any percentage between 0 and 100. The desired value can then be chosen by checking the box [ ] beside the Percentage button.

Step Settin	igs				Points

### Leak Test

Leak Test [ ]] is a device under test specific feature (uppermost picture below). The user selects the pressure module first or sets the device to "Autorange" and then defines a leak by setting the Setpoint, the time parameters and the Delta parameter (two lowermost pictures). With the system pressurized to a predetermined amount, the leak test is initiated by pressing the Start button. The device drives the pressure to the entered Setpoint and then switches to "Measure" mode. At this time the leak test is initiated. If the change in pressure exceeds the Delta parameter before the allotted time in the Time parameter, then the Leak Test will return a red status indication showing the actual difference (delta) in pressure recorded during time period set in the leak test, indicating a "failed" test. Otherwise it will return a green status indication showing that the delta was not exceeded for the time period, indicating a "passed" test.

Delta entry.

#### **Burst Test**

Burst Test [ ] is a device under test specific feature (uppermost picture below). The user selects the measurement module first or sets the device to "Autorange" and then programs a pressure burst by entering the low point and high point of pressure. For the device under test to pass the burst test, it must burst at a pressure greater than Low Point and less than the High Point. The user then enters a fast rate which is the control rate to reach the low pressure point and then enters the slow rate which is the control rate between the low and high pressure point. The burst test is initiated by pressing the Start button. The status of the test is shown next to the pressure reading (lowermost picture).

Burst test screen.

### **Service View**

The Service View [] ] can be found by navigating to the third page by clicking the Next Page [ ] button at the bottom right corner of the button section of the screen. It is a password protected area where calibration of all connected modules can be accomplished. In addition, this is where the password for entering this area can be changed.

Service view (locked).

Press the Enter button to show the numeric keypad to enter a password. This will unlock other functions. Default password is 123456. Enter 123456 and press the check mark [

Service			ii Pas	sword	
	0		1	2	3
			4	5	6
			7	8	9
•	Password	Enter		0	
				+	×

Service view. Entering a password.

The default Password is 123456. After entering this for the first time, the password can be changed.

### **Unlocked Service View**

After the Password has been entered, the unlocked Service view will appear (see picture below). To re-lock this screen, press the lock button.

Unlocked Service.

From the Unlocked Service view, the Password can be changed by pressing the Enter button next to the Change Password label. This will open a keypad where a new password can be entered and accepted by pressing the Check Mark [

Please make note of a password change and save the new password in a secure location.

The Unlocked Service view is the access point to all calibration screens described in Section 10 of this manual.

Note: Recommended calibration setup and explanation of calibration screen is covered in chapter Calibration on page 75 of this manual.

Notice

# **Remote Operation**

Use the screens in Section Remote view to set the operating parameters for the instrument command set, Ethernet, Serial (RS-232) and IEEE-488 (GPIB) information.

## **Command Set**

Command Set button – Users can select which model remote protocol they would like to emulate for simulation and testing purposes. Selections may include the following:

- Beamex (default)
- SCPI
- DPI5xx

#### **Operation with Beamex calibrators**

Connect the POC8 to the calibrator as shown below:

# **IEEE-488**

IEEE-488 address button – Allows the user to set the GPIB address by inputting a numeric value utilizing the touch screen.

### **IEEE-488.2 Commands**

Command or Query	Response / Function	
*IDN?	Returns identification string	
*RST	Reset to known state (default+psi)	
*TST?	Returns 1	
*OPC	Operation completed	
*WAI	Returns operation completed state	
*CLS	Clear status and error queue	
*ESE	Enable status event	
*ESE?	Returns enable status even value	
*ESR	Event status register	
*ESR?	Returns even status register value	
*SRE	Service request enable	
*SRE?	Returns service request enable value	
*STB?	Returns status byte	

# Ethernet

The Ethernet function allows the user to set the following by inputting a numeric value in each separate field:

- IP
- Netmask
- Gateway
- Port
- DHCP settings

Set the Ethernet communication parameters as described in chapter **Remote Operation** on page 49.

The Ethernet communication port allows the POC8 to communicate with computers using 10/100Based-T specifications.

Before using Ethernet communication, four parameters must be set up: IP, Netmask, Gateway, and Port.

# **USB device (Virtual Serial Port)**

The USB virtual serial communication port allows the POC8 to communicate with USB hosts, while retaining the semantics of legacy serial ports for application level. Settings are fixed as:

#### 57600 baud, 8 data bits, 1 stop bit, no parity.

Most modern operating systems have drivers for the used USB serial port converter.

### Serial

Set the Serial communication parameters as shown in chapter **Remote Operation** on page 49. The serial communication port allows the POC8 to communicate in RS-232 format with computers, terminals, PDAs, or similar hosts.

These parameters should be set to match your host computer. Default settings are: 9600 baud, 8 data bits, 1 stop bit, no parity, and no echo.

If echo is ON, the POC8 will immediately echo back characters sent over the serial port. The Serial function allows the user to set the RS-232 serial port settings by selecting from the choices provided:

Baud:

- 9600
- 19200
- 38400
- 57600
- 115200

Data Bits:

- 7
- 8

Stop Bits:

- 1
- 2

Parity:

- Even
- Odd
- None

Echo settings:

- On
- Off

### **Serial Cable Requirements**

RS-232 communications are transmitted over a three conductor, shielded cable terminated in a standard DB9 connector on the instrument end, and a different gender connector on the host end. The proper pin-outs are shown in the following illustration.

# **Command and Query Format**

Commands must be sent in ASCII format and terminated with either a carriage return (<cr>), linefeed (<lf>), or both. Commands are not case sensitive. Each query returns a response. If an error is detected the response will include an error flag.

Command or Query field: Unless otherwise specified, commands are typically converted to queries by appending a question mark to the command. A table in chapter **Beamex default command set** on page 55 lists all of the POC8 command or query keywords.

Data field: The data field is either in ASCII {string} or numeric {value} form. In the case of multiple data fields, commas are required to separate the fields. Queries do not have a data field. String (text) or value (numeric) data are acceptable in any of the following formats:

Examples of {string} data: ON, OFF, mBar, inHg

Examples of {value} data: 1, 1.0, -5.678, 25.68324e-5

# **Command Set Definitions**

In this manual, a data entry made up of alpha characters is defined as a string, as opposed to data containing only numbers, such as "Enter 1 for ON or 0 for OFF" where 1 and 0 are defined as values.

Command: Any command or query listed in a table in chapter **Beamex default command set** on page 55 . For commands that take boolean data the following strings are acceptable:

0	1
False	True
No	Yes
Off	On

Separator: Space (SP).

**Data:** ASCII representations of numbers, {value}, or alpha characters, {string}, data as defined above. When sending code a literal variable replaces the brackets and the enclosed character(s) shown in the following examples.

**Termination:** Linefeed (LF) or carriage return (CR) is used to signal the end of a command statement. For IEEE-488.2 operation "EOI" is an acceptable alternative.

Always send commands in one of the following formats:

[Command] [Termination];

[Command] [Separator] [Data] [Termination];

Queries are special instructions in the form:

[Command?] [Termination]

where the question mark, "?", immediately precedes the terminator.

When a valid query is received, the POC8 will return {data} terminated by CR and LF. Floating point data is returned in the current engineering units in exponential format.

# Output Formats

Pressure readings are returned in exponential notation in a format according to the OUTFORM command as follows:

<sp>> pressure value <cr><lf>

<sp> pressure, units number,STANDBY <cr><lf>

<sp> pressure, pressure rate <cr><lf>

<sp> pressure, minimum peak, maximum peak <cr><lf>

<sp> pressure, active sensor (P or S) active turndown (1-4)<cr><lf>

<sp> pressure, control point, "stable" or "slewing"<cr><lf>

<sp> pressure, "no barometer" or baro reading<cr><lf>

# **Commands and Queries**

### Beamex default command set

Command or Query	Data	Response/Function
?	See Table Below	Returns data per the current output for- mat
Acquire?	15 char string. Ex:	This command is used when multiple computers would like to control the in- strument.
Address	Acquire? Test_stand_1	Sets the GPIB Address
Address?		Returns the GPIB Address
Asset_tag	Returns:	General purpose string for customer use
Asset_tag?	<sp>(YES or NO), CCC CCC<cr><lf></lf></cr></sp>	Return customer asset tag string
Autorange	0-31	Sets whether the autorange function is enabled or disabled
Autorange?	<sp>nn<cr><lf></lf></cr></sp>	Returns whether the autorange function is enabled or disabled.
Autozero	none	Re-zero all the ranges. These adjust- ments are not password protected and are saved through power cycles. This command takes approximately 60 sec- onds but may take longer depending on the time to become stable.
Autozero?	S,T,X,X	Returns autozero data where S repre- sents state (0 = complete, 1 = local au- tozero, 2 = remote autozero), T repre- sents the estimated time to complete in seconds, and x is a (0) character since this data location is not used at this time.
Autozeroabort	none	Aborts autozero. Any sensors that have been zeroed will not revert to previous zero offsets.
Baro?	<sp>+n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns reading from barometric mod- ule or "NO BAROMETER" if one isn't installed
Calculate_as_found_ line arity		Calculate linearity slopes and intercepts from true/actual pressures
Caldisable	YES,NO	Sets whether or not calibration of the active module is disabled.
Caldisable?	<sp>(YES or NO)<cr><lf></lf></cr></sp>	Returns whether or not calibration of the active module is disabled.
Calspan	Current Pressure	Sets the internal span multiplier to achieve the sent pressure. Sending a "?" clears internal span

Error?	<sp> text description <cr><lf></lf></cr></sp>	Returns the next error in the error queue
DOM?	<sp>mm/dd/yyyy<cr><lf></lf></cr></sp>	Returns the date of manufacture
DOC?	<sp>mm/dd/yyyy<cr><lf></lf></cr></sp>	Returns the date of cal for the active pressure module.
DHCP?	<sp>(YES or NO)<cr><lf></lf></cr></sp>	Reserved for DHCP setup
DHCP	ON or OFF	Reserved for DHCP setup
Default	None	Sets the default values
Decpt?	<sp>n<cr><lf></lf></cr></sp>	Returns the number of decimal points (see Resolution)
Ctype?		Returns the type of controller
Crate?	<sp>CCCCCC<cr><lf></lf></cr></sp>	Returns the control rate – CCCC is vari- able in length and corresponds to the parameters for the CRATE command
Crate	Slow, Medium, Fast, Varia- ble	Sets the control rate, Variable mode is a predetermined user defined rate setpt.
Control?	<sp>(YES or NO)<cr><lf></lf></cr></sp>	Returns YES if instrument is in control. NO if otherwise
Control		Instrument placed in Control Mode
Cmdset?	<sp><cccccc><cr><lf></lf></cr></cccccc></sp>	Returns active command set identifier
Cmdset	Mensor, DPI510, SCPI	Activates remote command set for in- strument emulation modes.
CID?		Returns the ID string of the controller
Chanfunc3?	<sp>CCCCC<cr>&lt;.lf&gt;</cr></sp>	Returns the tertiary alternate function mode
Chanfunc3	Press, peak, rate, rate setpt, dio, units	Sets the tertiary display function mode
Chanfunc2?	<sp>CCCCC<cr>&lt;.lf&gt;</cr></sp>	Returns the secondary alternate func- tion mode
Chanfunc2	Press, peak, rate, rate setpt, dio, units	Sets the secondary display function mode
Chanfunc?	<sp>CCCCCC<cr>&lt;.lf&gt;</cr></sp>	Returns the secondary alternate func- tion mode, works identical to Chanfunc2
Chanfunc	Press, peak, rate, rate setpt, dio, units	Sets the secondary display function mode, works identical to Chanfunc2
Cerr	None	Clears the error queue
CalZero?	<sp>+n.nnnnE+nn<cr><lf></lf></cr></sp>	Returns the zero offset in psi stored in the active turndown
CalZero	Nnnnnn	Sets the internal zero to achieve the sent pressure. Sending a "?" clears the internal zero.
Calspan?	<sp>+n.nnnnE+nn<cr><lf></lf></cr></sp>	Returns the span multiplier stored in the active turndown

DOC	mm/dd/yyyy Sets the date of cal for the active sure module.		
Filter	OFF, LOW, NORMAL, HIGH Sets the reading filter 0, 80%, 92 95%		
Filter?	<sp> (filter)<cr><lf></lf></cr></sp>	Returns the reading filter.	
Gasdensity	Value in lb/cuft, or "NITROGEN" or "DRYAIR"	Sets the head pressure gas density in lb/cuft	
Gasdensity?	<sp>+n.nnnnnE+nn<cr></cr></sp>	Returns the serial data bits number	
Gastemp	Value in degrees F	Sets the head pressure gas tempera- ture	
Gastemp?	<sp>+n.nnnnnE+nn<cr><lf></lf></cr></sp>	Gets the head pressure gas tempera- ture	
Gateway	nnn.nnn.nnn	Sets the Ethernet gateway address	
Gateway?	<sp>nnn.nnn.nnn.nnn<cr><l< td=""><td>Gets the Ethernet gateway address</td></l<></cr></sp>	Gets the Ethernet gateway address	
Height	Value in inches	Sets the head pressure height in inches	
Height?	<sp>+n.nnnnnE+nn<cr><lf></lf></cr></sp>	Gets the head pressure height in inches	
ld?	<sp>BEAMEX,POC8, ssssss,v.v.vv<cr><lf></lf></cr></sp>	Ssssss is the serial number,v.v.vv is the POC8 software version.	
IP	nnn.nnn.nnn	Sets the IP address of the instrument	
IP?	<sp>nnn.nnn.nnn.nnn<cr><l< td=""><td>Returns the IP address of the instru- ment</td></l<></cr></sp>	Returns the IP address of the instru- ment	
Keylock	YES or NO	Locks or unlocks the entire touch screen	
Keylock?	<sp>(YES or NO)<cr><lf></lf></cr></sp>	Returns Yes or No	
Linearity_pts	n	n = number of linearity points (11 max)	
Linearity_pts?	<sp>n<cr><lf></lf></cr></sp>	Returns the number of linearity points	
Linearity_seg <sp>[n]</sp>	n,f	n = linearity point, f = linearity segment value	
Linearity_seg? <sp>[n]</sp>	<sp><f><cr><lf></lf></cr></f></sp>	Returns the segment value for the point	
Linearity_slp <sp>[n]</sp>	n,f	n = linearity point, f = linearity slope value	
Linearity_slp? <sp>[n]</sp>	<sp><f><cr><lf></lf></cr></f></sp>	Returns the segment slope for the point	
Linearity_int <sp>[n]</sp>	n,f	n = linearity point, f = linearity intercept value	
Linearity_int? <sp>[n]</sp>	<sp><f><cr><lf></lf></cr></f></sp>	Returns the segment intercept for the point	
List?	<sp>Pri,1;Sec,1;Ter,1;Bar,1 <cr><lf></lf></cr></sp>	Returns list of available pressure mod- ules and turn downs. Turn downs are obsolete and therefore set to 1 for backwards compatibility.	
Listcal?	<sp>PRI,{sn},1,{mmddyy};S EC,{sn},1,{mmddyy},TER,{s n},1,{mmddyy}, Bar,{sn},{ mmddyy}<cr><lf></lf></cr></sp>		

Listrange?	<sp>PRI,1,min,max;SEC,1, min,max;TER,1,min,max;Ba r,min,max</sp>	Returns the ranges of the installed measure modules.
Locale	II_CC	Sets the locale, posix locale names en_US = English,U.S.A. de_DE = German, Germany etc
	K	
Locale?	<sp>II_CC<cr><lf></lf></cr></sp>	Returns the posix locale of the instru- ment
Localgravity	Value in ft/s^2	Sets the local gravity in feet/sec^2
Localgravity?	<sp>+n.nnnnE+nn<cr><lf></lf></cr></sp>	Returns the local gravity in feet/sec^2
LowerLimit	Value inside primary xducer range in current units.	Sets the lower control limit for the in- strument
LowerLimit?	<sp>n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns the lower control limit for the in- strument in current units.
Measure	None	Instrument placed in Measure Mode
Measure?	<sp>(YES or NO)<cr><lf></lf></cr></sp>	Returns YES if instrument is in meas- ure. NO if otherwise
Mode	STANDBY, MEASURE, CONTROL, VENT	Sets the operation mode
Mode?	<sp>XXXXXX&lt;<cr><lf></lf></cr></sp>	Returns the operation mode
Netmask	nnn.nnn.nnn	Sets the Ethernet network mask
Netmask?	<sp>nnn.nnn.nnn.nnn<cr><li>f&gt;</li></cr></sp>	Gets the Ethernet network mask
Options?	<sp>o[,0[,0]]<cr><lf></lf></cr></sp>	Returns list of installed options
Outform	1 to 7 – see table below	Sets the output format
Outform?	<sp>X<cr><lf></lf></cr></sp>	Returns the output format – see table below
Peakmax?	<sp>n.nnnnE+nn<cr><lf></lf></cr></sp>	Returns the maximum pressure since peakreset was sent.
Peakmin?	<sp>n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns the minimum pressure since peakreset was sent.
Peakreset	None	Resets the peak values.
Percent	Value in percent	Sets an exact measure filter percent
Percent?	<sp>n.nnnnE+nn<cr><lf></lf></cr></sp>	Returns the filter percent
Port	nnnnn	Sets the Ethernet port of the instrument
Port?	<sp>nnnn<cr><lf></lf></cr></sp>	Returns the Ethernet port of the instru- ment
Precision	none	Sets the precision mode: .003% stable window and 4 second stable delay
Ptype	Absolute or Gauge	Sets the instrument pressure type – emulation only works if the optional bar- ometric module is installed
Ptype?	<sp>CCCCC<cr><lf></lf></cr></sp>	Returns "Absolute" or "Gauge" for the pressure type

RangeMax?	<sp>n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns the maximum range of the ac- tive pressure module in the current units.
RangeMin?	<sp>n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns the minimum range of the ac- tive pressure module in the current units.
Rate?	<sp>n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns the rate reading of the instru- ment in current units/current time unit (see: Runits)
Rdecpt?	<sp>n<cr><lf></lf></cr></sp>	Returns the number of rate decimal points. (see Resolution)
Reference	{EXTVAC or ATM}	Sets the reference type for vacuum pump connected to the reference, or vented to atmosphere. This option is available only on native gauge units.
Reference?	<sp>{EXTVAC or ATM}<cr><lf></lf></cr></sp>	Returns the current reference type. See: Reference
Release?	15 char string. Ex: Release? Test_stand_1 Returns: <sp>(YES or NO), CCC CCC<cr><lf></lf></cr></sp>	This command is used to release con- trol of the instrument in a multiple com- puter environment. Yes if release is successful
		No if instrument is being controlled with another computer CCC = name of controlling computer or AVAILABLE
		O a av A a av da O a a al Llada al v
		See: Acquire? and Unlock
Repeat	None	Repeats output continually over serial port.
Repeat Resolution	None <pre></pre>	Repeats output continually over serial
·		Repeats output continually over serial port. Sets the number of significant digits.
Resolution	<n></n>	Repeats output continually over serial port. Sets the number of significant digits. See: decpt Returns the number of significant digits.
Resolution Resolution?	<n> <sp>n<cr><lf></lf></cr></sp></n>	Repeats output continually over serial port. Sets the number of significant digits. See: decpt Returns the number of significant digits. See: decpt
Resolution Resolution? Rfilter	<n> <sp>n<cr><li>Value in %</li></cr></sp></n>	Repeats output continually over serial port.Sets the number of significant digits. See: decptReturns the number of significant digits. See: decptSets the % of the rate filter

Sbaud	9600, 19200, 38400, 57600, 115200	Sets the serial baud rate	
Sbaud?	<sp>XXXX<cr><lf></lf></cr></sp>	Returns the serial baud data	
Sdata	7 or 8	Sets the serial data bits	
Sdata?	<sp>n<cr><lf></lf></cr></sp>	Returns the serial data bits number	
Sensor	1,2 or PRIMARY, SECONDARY	Sets the active measurement module	
Sensor?	<sp>XXXXXXX,1<cr><lf></lf></cr></sp>	Returns active measurement module in long string format	
Setpt	value inside upper and lower limits	Sets the control setpoint for the instru- ment	
Setpt?	<sp>XXXXXXX&lt;<cr><lf></lf></cr></sp>	Returns the control setpoint in current units.	
Setpt%	Value in % of current range	Sets the control setpoint in % of current range	
Setptpct	Value in % of current range	Sets the control setpoint in % of current range	
Setptpct?	<sp>n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns the current setpoint in % of cur- rent range	
Span	desired pressure or ?	Sets span on active pressure module or for ?, clears previous value, must be > 50% FS and has a 1% limit. CALDISABLE must be OFF/NO.	
Span?	<sp>XXXXXXXX&lt;<cr><lf></lf></cr></sp>	Returns span scale factor for active pressure module	
Sparity	Even, ODD, NONE	Sets the serial parity	
Sparity?	<sp>CCCC<cr><lf></lf></cr></sp>	Returns the serial parity	
Srqmask	Stable,Error or both	Sets the POC8 to issue a service re- quest (SRQ) over the IEEE when the pressure Control is stable, or an error occurs. These are 80 hex and 40 hex respectively	
Srqmask?	<sp>{string}<cr><lf></lf></cr></sp>	Returns "stable", "error" or "error, stable" depending on the SRQ.	
Sstop	1 or 2	Sets the serial stop bits	
Sstop?	<sp>X<cr><lf></lf></cr></sp>	Returns the serial stop bits	
Stable?		Returns YES if instrument is stable or No	
Stabledelay	0 to 65535	Sets the stable time to the number of seconds specified	
Stabledelay?	<sp>XXXXXXX&lt;<cr><lf></lf></cr></sp>	Returns the stable time.	
stabletime	0 to 65535	Sets the stable time to the number of seconds specified	
Stabletime?	<sp>XXXXXXX&lt;<cr><lf></lf></cr></sp>	Returns the stable time.	
StableWin	%fs value	Sets the stable window as a %FS	
StableWin?	<sp>n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns the stable window.	

Standby	None	Instrument placed in Standby Mode
Standby?	<sp>(YES or NO)<cr><lf></lf></cr></sp>	Returns yes if instrument is in Standby, no if otherwise
Step	Value inside upper and lower limits and inside the range of the active pressure module.	Sets the control step size for the instru- ment
Step-		Jogs the setpoint down one step
Step+		Jogs the setpoint up one step
Step?	<sp>+n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns the control step for the instru- ment
Step%	Value in % of current range	Sets the control step in % of current range
Steppct	Value in % of current range	Sets the control step in % of current range
Steppct?	<sp>n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns the current step in % of current range
Stop	None	Stop repeating output over serial port – see repeat
Tare	ON / OFF	Tares the reading to zero
Tare?	<sp> n.nnnnnE+nn <cr><lf></lf></cr></sp>	Returns value of Tare
Units	units code or text in table below	Sets the instrument engineering units
Units?	<sp>CCCC<cr><lf></lf></cr></sp>	Returns the instrument units in a text string
Unlock	None	Releases Acquire locks
UpperLimit	Value inside primary xduc- erRange in current units.	Sets the Upper control limit for the ac- tive pressure module.
UpperLimit?	<sp>xxxxxx<cr><lf></lf></cr></sp>	Returns the upper control limit for the active pressure module.
Vent	None	Instrument placed in Vent Mode
Vent?	<sp>(YES or NO)<cr><lf></lf></cr></sp>	Returns yes if instrument is in Vent, no if otherwise
Volume	Value in cc	sets the system volume in cc's – only applicable for the pump
Volume?	<sp>Xxxxxx&lt;<cr><lf></lf></cr></sp>	Returns the current system volume in cc's
Window	Value in current units	Sets the exponential filter window for the active pressure module
Window?	<sp>n.nnnnE+nn<cr><lf></lf></cr></sp>	Returns the exponential filter window for the active pressure module
Zero	desired pressure or ?	Sets zero to set pressure or for ?, clears previous value. CALDISABLE must be OFF/NO.
Zero?	<sp>n.nnnnnE+nn<cr><lf></lf></cr></sp>	Returns zero offset for active pressure module

# Units Command Syntax for Measurement Units

n	Description	Output Format	Туре
1	pounds per square inch	PSI	Imperial
2	inches of mercury @ 0°C	INHG	Imperial
3	inches of mercury @ 60°F	INHG	Imperial
4	inches of water @ 4°C	INH2C	Imperial
5	inches of water @ 20°C	INH2O	Imperial
6	inches of water @ 60°F	INH2O	Imperial
7	feet of water @ 4°C	FTH2O	Imperial
8	feet of water @ 20°C	FTH2O	Imperial
9	feet of water @ 60°F	FTH2O	Imperial
10	millitorr	MTORR	Metric
11	inches of sea water @ 0°C	INSW	Imperial
12	feet of sea water @ 0°C	FTSW	Imperial
13	atmospheres	ATM	Imperial
14	bars	BAR	Metric
15	millibars	MBAR	Metric
16	millimeters of water @ 4°C	MMH2O	Metric
17	centimeters of water @ 4°C	CMH2O	Metric
18	meters of water @ 4°C	MH2O	Metric
19	millimeters of mercury @ 0°C	MMHG	Metric
20	centimeters of mercury @ 0°C	CMHG	Metric
21	torr	TORR	Metric
22	kilopascals	KPA	Metric
23	pascals	PA	Metric
24	dynes per square	DY/CM <sup>2</sup>	Metric
25	grams per square centimeter	G/CM <sup>2</sup>	Metric
26	kilograms per square	KG/CM <sup>2</sup>	Metric
27	meters of sea water @ 0°C	MSW	Metric
28	ounce per square	OSI	Imperial
29	pounds per square foot	PSF	Imperial
30	tons per square	TSF	Imperial
32	micron of mercury @ 0°C	mHG	Metric
33	tons per square	TSI	Imperial
34	hectapascals	HPA	Metric
36	megapascals	MPA	Metric
37	millimeters of water @ 20°C	MMH2O	Metric
38	centimeters of water @ 20C	CMH2O	Metric
39	meters of water @ 20°C	MH2O	Metric

Code	Serial Poll Byte	Description	Error String Returned
E00	00h	No errors	NO ERRORS
E05	45h	Parameter error	EGPIB PARAMETER ERROR: <string sent="" that="" was=""></string>
E07	47h	Syntax error	EGPIB SYNTAX ERROR: <string sent="" that="" was=""></string>

### **Error Codes**

### **SCPI Commands and Queries**

Except for the engineering units selection, the numeric suffix selects the applicable channel/sensor:

1= Channel A

2= Barometer (if installed)

This numeric suffix always defaults to 1 and is designated by [C] (channel)

Command	Response/Function
STATus	
:OPERation	
:CONDition?	Returns an integer value representing instrument status that can be decoded. Bit 0: Zeroing active Bit 1: Control Setpoint has not been reached. Bit 2: Reserved 0. Bit 3: Reserved 0. Bit 5: Measuring. The instrument is actively measuring
MEASure	
[:PRESsure][R]?	Returns the pressure from range R
:TEMPerature[R]?	Returns the temperature from range R
:RATE[R]?	Returns the rate/sec from range R
:BAROmetric?	Returns the barometric pressure
CALibration	
[:PRESsure][R]	
MODE?	Returns 1=calibrated or 0=not calibrated
:DATE?	Returns date of cal "MM/DD/YY"
:DATE <i,i,i></i,i,i>	Sets date of cal YYYY,MM,DD
:ZERO?	Returns zero offset
:ZERO <n></n>	Sets the zero offset
:ZERO:RUN	Start Autozero sequence
:ZERO:STOP	Stop Autozero sequence
:ZERO:INITiate?	Returns zero status
:ZERO:INITiate	Ignored
SENSe	

Command	Response/Function
[:PRESsure][R]	
:NAME?	Returns transducer name string
:MODE?	Returns "ABSOLUTE" or "GAUGE"
:MODE ABS   GAUGE	Sets pressure type
:ABS?	Returns native transducer type 0=GAUGE 1=ABSOLUTE
:RESolution?	Returns resolution (float)
:RANGe	
[:UPPer]?	Returns maximum range
:LOWer?	Returns minimum range
:UNIT	
[:NAME]?	Returns ASCII units (mixed case)
:VALue?	Returns the units conversion factor
:REFerence	
[:HEIGht] <n></n>	Sets the head pressure height
:HEIGht?	Returns the head pressure height
:MODE?	Returns "OFF", "DRYAIR", or "NITROGEN"
:MODE OFF     HELIUM   DRY AIR     NITROGEN	Sets the head pressure mode
:MEDium <n></n>	Sets the medium density
:MEDium?	Returns medium
:ACTive <n></n>	Sets the active transducer
ACTive?	Returns the active transducer
SYSTem	
:DATE <i,i,i></i,i,i>	Not used, kept for backwards compatibility
:DATE?	Not used, does not cause an error, does not return a re- sponse
:TIME <i,i,i></i,i,i>	Not used, kept for backwards compatibility
:TIME?	Not used, does not cause an error, dose not return a re- sponse
:ERRor[:NEXT]?	Returns error code, description
:KLOCk ON   OFF   1   0	Sets the keylock state
:PRESet	Load known state values
:SAVe	No function (not needed)
:VERSion?	Returns SCPI version 1994.0
TEST	
:ELECtronic?	Returns "OK"
:RELay <n>?</n>	Returns status of digital output <n></n>

Command	Response/Function	
:RELay <n> ON   OFF</n>	Turns the digital output on o	r off <n></n>
UNIT		
:[PRESsure] bar   mbar   Pa     psi	Sets the pressure units	
:[PRESsure]?	Returns the pressure units	
:NAME <n>?</n>	Returns the units string for u	inits code <n></n>
:FACTor <n>?</n>	Returns the units conversior	n for units code <n></n>
:INDEX <n></n>	Sets the index number.	
:INDEX?	Returns the index number.	
	$\frac{index unit}{0 bar}$ 1 mbar 2 Pa 3 psi 4 atm 5 kp/cm2 6 lbf/ft2 7 kPa 8 cmH2O(4°C) 9 inH2O(4°C) 10 inH2O(60°F) 11 ftH2O(4°C) 12 $\mu$ mHg(0°C) 13 mmHg(0°C) 14 cmHg(4°C) 15 inHg(0°C) 16 inHg(60°F) 17 18 user 19 user 20 user	index unit 21 OSI 22 TSI 23 TSF 24 ftH2O(20°C) 25 ftH2O(60°F) 26 inSW 27 ftSW 28 hPa 29 Mpa 30 dyn/cm2 31 mHg 0°C 32 Torr 33 mTorr 34 uHg 0°C 35 mmH2O 4°C 36 mH2O 4°C 36 mH2O 4°C 37 mmH2O 20°C 38 cmH2O 20°C 39 mH2O 20°C 40 mSW 41 g/cm2 42 Kg/m2
		42 Kg/m2
OUTPut		
:STATe ON   OFF   1   0	ON or 1 = Control OFF or 0	
:STATe?	Returns 0 for measure 1 for	control
:MODE MEASure   CONTrol     VENT	Sets the mode indicated	
:MODE?	Returns the mode string	
:STABle?	Returns 1 if stable 0 if not	
:AUTOvent ON   OFF   1   0	Autovent is always true on C	CPC4000
:AUTOvent?	Returns the state of the Vent mode	
:AUTORange ON   OFF   1   0	Turns autorange on or off	

Command	Response/Function
:AUTORange?	Returns "ON" or "OFF"
[SOURce]	
:PRESsure	
[:LEVel]	
[:IMMediate]	
[:AMPLitude] <n></n>	Sets the setpoint
[:AMPLitude]?	Returns the setpoint
:RSETPT <n></n>	Sets the rate setpoint in current units
:RSETPT?	Returns the rate setpoint in current units
:SLEW <n></n>	Sets the rate setpoint in %FS/sec
:SLEW?	Returns the rate setpoint in %FS/sec
:TOLerance?	Returns the stable window
:TOLerance <n></n>	Sets the stable window
CALCulate	
:LIMit	
:LOWer <n></n>	Set the minimum control limit
:LOWer?	Returns the minimum control limit
:UPPer <n></n>	Set the maximum control limit
:UPPer?	Returns the maximum control limit
:SYSTem	
:DETECT SLOW   FAST     CANCEL	Not used, kept for backwards compatibility
:DETECT?	Returns "0"

#### **GPIB Capability Codes**

All remote commands sent to the POC8 are shown in the Trouble Shooting view, under the "Remote" button. If there is a syntax error, an error message will appear below the errant command. Local errors and remote command errors will appear under the "Error" button. Maximum of 100 errors are stored and can be retrieved.

#### **GPIB Capability Codes**

- SH1 Full source handshake capability
- AH1 Full acceptor handshake capability
- T6 Talker with serial poll and unaddress if MLA
- L4 Listener with unaddress if MTA
- SR1 Full service request capability
- L1 Full remote/local capability including LLO
- PO No parallel poll capability
- DC1 Full device clear capability
- DT1 Full device trigger capability

- C0 No controller capability
- E2 Tri-state outputs

#### **Interface Functions**

POC8 responds to the following IEEE.488.2 interface functions:

- SRQ Service Request: A service request is asserted whenever an error is encountered. When the bus controller issues a serial poll the error will be cleared. If the host IEEE board includes automatic serial polling capability, turn this feature off in order to view all errors.
- LLO Local Lockout: The front panel keyboard of the device may be locked by sending LLO or the command KEYLOCK ON.
- GET Group Execute Trigger: When this message is received, the device will save the current readings until the next time it is addressed as a talker.
- GTL Go To Local: A GTL message will cause the device to return to local operation and unlock the keyboard.
- DCL Device Clear: When this message is received, the device will clear all errors and buffers and remain in the Remote mode.
- SDC Selected Device Clear: The effect is the same as DCL.
- EOI End or Identify: May be used as a command or query terminator in the place of, or concurrent with, a terminating linefeed.

#### **USB Software Upgrade**

The instrument software can be upgraded to the most recent release by copying the instrument software from the Beamex website onto a USB device. The user can then plug the USB device to the USB port on the front panel of the instrument for an easy upgrade. The instrument recognizes this device by displaying a USB icon on the top bar of the screen (uppermost picture below). The user can navigate to the Software upgrade menu by clicking on the USB icon. The software upgrade menu gives the user information on the current instrument software and the version of instrument software on the USB device (lowermost picture below).

The user can load the instrument software from the USB to the instrument by clicking on the desired version and then clicking [ ] button. The status of the installation can be seen on right one fourth of the screen.

The user also has the option to copy and load program test sequences from the USB drive which can later be accessed through the Programs view menu.

Home View with USB Icon.

## Options

- Barometric Module (for gauge and absolute emulation) (9891930)
- Additional Measurement Module
  - o 350 mbar / 5 psi (9891860)
  - 1 bar / 14.5 psi (9891870)
  - o 6 bar / 87 psi (9891880)
  - 20 bar / 290 psi (9891890)
  - 100 bar / 1450 psi (9891900)
  - o 210 bar / 3045 psi (9891910)
  - Special range, contact Beamex (9891920)
- Bench Mounting Kit (9891850)
- Pressure hose for output pressure
  - T-hose set with connectors for low pressure (8009550)
  - Extension hose (straight) for low pressure (8009560)
  - T-hose set for high pressure (8170200)
  - Hose set (straight) for high pressure (8003365)
- Vacuum pump
  - Vacuum Pump 110 V (9427110)
  - o Vacuum Pump 230 V (9427230)
  - Vacuum pump switch set for panel (9972405)
  - Swivel stand for vacuum pump (9972410)
- Contamination Prevention Accessories
  - o DMT40 Dirt and Moisture Trap for max. 40 bar / 580 psi (9010900)
  - o DMT210 Dirt and Moisture Trap for max. 210 / 3050 psi pressure (9010910)

#### **Barometric Module**

The Barometric Module is an absolute pressure module used to accurately measure local atmospheric pressure. This module is in a different housing compared to the regular modules. It is removable by taking off the top cover of the chassis.

The POC8 uses the barometric pressure, measured by the barometric module, for pressure mode emulation in the channels. If a barometric module is installed the Pressure Mode button in the Home view (main screen) will become active and, when pressed, will toggle between Absolute and Gauge mode (see chapter **Home View** on page 18). The barometer reading can also be read at the bottom of the buttons in the Home view.

#### **Gauge Pressure Emulation**

In the Home view (main screen) an absolute pressure module channel will indicate "Absolute" in the mode button (this is the default mode). When this button is pressed the button label will toggle to "Gauge" and have a lighter background color. The lighter background color is an indication that the channel is in emulation mode.

In the gauge emulation mode the atmospheric pressure reading from the barometric reference module is subtracted from the absolute pressure reading to emulate a gauge pressure.

#### **Absolute Pressure Emulation**

In the Home view (main screen) a gauge pressure module channel will indicate "Gauge" in the mode button (this is the default mode). When this button is pressed the button label will toggle to "Absolute" and have a lighter button background color. The lighter background color is an indication that the channel is in emulation mode.

In the absolute emulation mode the atmospheric pressure reading from the barometric module is added to the gauge pressure reading to emulate an absolute pressure.

#### **Emulation Mode Accuracy**

The accuracy in emulation mode is different for gauge and absolute emulation mode.

The barometric module has six significant digits and has a guaranteed drift of 0.0002827 mbar / 0.0000041 psi over a 24 hour period which has no significant effect on the emulated gauge pressure uncertainty.

The absolute uncertainty of the barometric module must be considered in the emulated absolute pressure uncertainty.

#### **Calibration of the Barometric Module**

The Barometric Module can be calibrated in exactly the same manner as the other installed modules as described in section Calibration.

#### **Specifications of the Barometric Module**

Accuracy: 0.02% of reading. Uncertainties include all pressure effects, temperature effects over the calibrated range and calibration stability for 365 days after re-zeroing.

Pressure Range: The standard Barometric Module is calibrated from 0.55 to 1.17 bara / 8 to 17 psia. Resolution: 6 digits.

## Additional measurement modules

A secondary measurement module of any standard range, can be purchased as an option. In all other regards, the add-on module will meet all of the specifications and operating parameters outlines throughout this manual.

Typically, the pressure control unit in each device has limits of 10, 100 or 210 barg / 150, 1500 or 3,045 psig. If a measurement module is placed into a device where the control unit has a higher upper pressure range, the maximum control limit will be limited to the maximum range of the measurement module.

While any measurement module will function in any device, the results may not always be optimum. For example, if a 1 bar / 14.5 psi module is placed in a device that has a 100 bar / 1500 psi upper limit, the controlled pressure stability may not be acceptable.

#### Secondary measurement module installation

If the add-on measurement module is of a higher full scale range than the existing primary module, then this newer module becomes the Primary, and the existing module must be moved to the Secondary Module slot. For complete installation instructions see chapter **Removing the measurement module** on page 73.

## **Bench Mounting Kit**

A rack mount kit is used to install POC8 into Beamex MCS200 Calibration Workstation.

POC8 Rack Mount Kit.

See also Appendix, chapter Installing POC8 to MCS200 Module Rack on page 86.

#### **Fittings**

POC8 is delivered with proper pressure connectors and hoses for supply pressure and vacuum. The Barometric Module comes with a standard Barb fitting.

### **Re-calibrating**

We recommend having the system re-calibrated by the manufacturer at regular intervals of approximately 12 months. Every re-calibration at the factory also includes a comprehensive and free checking of all system parameters.

POC8 requires almost no maintenance, because all moving parts are extremely robust. There are no parts which have to be serviced by the user.

During each re-calibration the function of the integrated relief valves are checked.

Please contact Beamex when it is time to re-calibrate your POC8.

If you have installed POC8 in MCS200 module rack, check chapter **Installing POC8 to MCS200 Module Rack** on page 86 to get an overview how to remove your POC8 form the module rack. No pressure tubes or communication cables etc. need to be sent to Beamex when doing a recalibration, only the main unit. Disconnect all tubes and cables, loosen clamps and remove front panel plate. Then push out the main unit.

#### **Dirt and Moisture Trap**

Beamex Dirt and Moisture trap allow the user to operate POC8 in contamination prone areas. It prevents in > 90 % efficiency contaminants like any liquids, oil or dirt to enter POC8 when the direction of pressure flow is from device under test (DUT) to POC8 or when the device under test is vented.

# Maintenance

POC8 is designed for maintenance-free operation. User maintenance is not recommended. If you have questions not covered by this manual, please contact Beamex.

#### Removing the measurement module

Follow the following instructions for removing or replacement the measurement module:

- 1. VENT THE SYSTEM by placing the device in vent mode. Then turn off the power.
- Loosen the five Philips screws on the top cover of the device as seen in picture "Top view of POC8" below and open the top cover to reveal the insides of the chassis (picture "Chassis assembly").
- 3. Unscrew the thumb screw holding in the measurement module (lowermost picture below).
- 4. Apply a light inward pressure against the bottom of the module case, just below the range label, while tilting the case upward to clear the clamp plate and screw head.
- 5. Pull the module outward, through the top opening.

There must be a measurement module installed in the "Primary Module" slot for the system to function properly. If the system is operated with the primary slot empty the system will display an error.

Top view of POC8.

Chassis assembly.

Measurement Module.

Further access to the interior of the device is NOT recommended. There are no user-serviceable plumbing or parts inside. In addition to the dangerous voltages present (line voltage), there are circuits sensitive to electrostatic discharge damage.

ESD PROTECTION REQUIRED! The proper use of grounded work surfaces and personal wrist straps are required when coming into contact with exposed circuits (printed circuit boards) to prevent static discharge damage to sensitive electronic components.

If faults cannot be corrected locally, immediately take the system off line and protect it from unintentional restarts. Contact Beamex for further instructions.

Servicing of electrical, electronic or pneumatic equipment must be performed by qualified and authorized technical staff, observing all relevant safety regulations.

## Troubleshooting

Problem / Type of Fault	Correction	
The device has been switched on and no measurement(s) have ap- peared and the entire area of the screen is white (or dark).	Switch the device off. Wait 5 seconds and switch the device on.	
The screen is dark and the correc- tive action for #1 above has no ef- fect.	Check that the power cable is connected properly and have authorized technical staff check that the supply voltage is correct.	
The screen is dark and the action taken to solve the problem of #2 above has no effect.	Unplug the unit from the power source (wall socket), then remove the power cord from the in- strument. The power cord input socket includes two internal fuses. Check both fuses for continuity. WARNING! When needed, use only 1.25 amp 250V SLO-BLO 5x20 Fuse.	
Malfunction during operation.	Switch the device off. Wait 5 seconds and switch the device on.	
Unstable control.	Consult Beamex.	
The setpoint value is not reached.	Check whether the value of the supply pressure is the value required, and leak test the plumbing.	

# Calibration

The POC8 automatically adjusts the pressure reading for the effects of temperature and nonlinearity within the calibrated temperature range of 15 - 45°C. The process is referred to as dynamic compensation because each reading is so adjusted before it is output to the display or to a communication bus. Thus, a calibrated device operated within its temperature band, and with proper zero and span adjustments, will provide accurate pressure measurements.

The POC8 should have the calibration verified periodically to insure stability. The recommended calibration cycle is one year or six months depending on the pressure module range.

#### Environment

For maximum accuracy, allow the device to warm up a minimum of 15 minutes in ambient temperature within the compensated range prior to a calibration. In addition, the device should be at rest on a stable platform that is free of excessive vibration and shock.

### **Pressure Standards**

It is recommended to use appropriately accurate primary pressure standards when calibrating this instrument. Such standards should be sufficient so that when the techniques of the ISO Guide to the Expression of Uncertainty in Measurement (GUM) are applied, the device meets its accuracy statements as required by ISO/IEC 17025:2005, or other applicable standards.

#### Media

The recommended calibration medium is dry nitrogen or clean dry instrument air. A height variation between the standard and the POC8 can cause significant errors. A calculation should be made to compensate for this difference. This compensation can be done as presented in chapter **Head Pressure** on page 81.

#### Service View (unlocked)

The Service view can be accessed and unlocked by following the instructions in chapter **Service View** on page 47. The unlocked Service view will appear (see picture below). To re-lock this screen, press the Lock button.

Unlocked Service view.

From the unlocked Service view, the Password can be changed by pressing the Enter button next to the Change Password label. This will open a keypad where a new password can be entered and accepted by pressing the Check [

Please make note of a password change and save the new password in a secure location.

The Unlocked Service view is the access point to all calibration screens described further on.

## **Calibration Data**

The Calibration Data view []] is where the calibration data for each measurement module is stored and amended. The Serial number (S/N), Zero offset (Zero) and Span offset (Span) can be seen in this screen. The date of calibration, the calibration interval and the certificate number can be entered by pressing the corresponding button, then saved by pressing the Check []] button. To revert back to the factory calibration, press the "Restore Factory Cal" button. To view the calibration data for each module press the "Channel" button at the top and choose a module from the resulting channel selection menu.

🚆 Calibration Data		🔛 Menu	
Range: 41000CDL 0.000	211.000 bar	3	•
S/N	41000CDL		
Accuracy	0.020% FS		1428
Zero	0.0367	K.	
Span	1.00000		_

Cal Interval	365		<b>.</b>
Certificate		1.01944 baı	rA
Restore Factory Cal			•

Calibration Data.

## **One Point Calibration**

A Single Point Calibration [ ] (usually a zero point calibration) of each measurement module installed can be accomplished in "One Point Cal" tool. The module channel is chosen by pressing the "Channel" button at the top of this screen, and then selecting from the list of installed module channels. For gauge pressure simply expose the reference and the pressure port of the module to atmospheric pressure and then press the "New Value" button and enter zero (0) using the keypad. For an absolute module apply a known reference pressure to the pressure port of the pressure module, press the "New Value" button and then enter the reference pressure (known true pressure) using the keypad. If you want to save the value in the module, press Save.

Notice the reference symbol [ ] ]. This is a reference indication giving a constant reference point for the level of the internal sensor.

One point calibration.

#### **Two Point Calibration**

Two Point Calibration [ Provides a place to adjust the measurement module Zero and Span (sometimes referred to as the offset and slope).

Two Point Calibration.

Follow the steps below for a complete 2 Point Calibration:

Select a measurement module to calibrate by pressing the Channel button at the top of the screen.

#### To calibrate the "Low Point":

- 1. The pressure port of the module being calibrated should be supplied with a suitable, "low point" pressure (see chapter **Rear Panel** on page 13 for the port location).
- 2. For a gauge module(s), this low point pressure can be achieved by opening the pressure and reference ports to atmospheric pressure.
- 3. For an absolute module(s) a suitable source of vacuum should be applied to the Pressure port along with a high accuracy vacuum standard or a pressure calibration standard can be connected to the Pressure port that can generate and measure a pressure value. In either case the pressure should be measured at a stable value that is within 20% of the minimum range of the selected internal pressure module.
- 4. When the pressure is stable, record the live reading shown on the Two Point Cal screen and enter this value as the "Low Reading" by pressing the Low Reading button and entering the number followed by the Check [ ] ] button. Record the "true pressure" obtained from the reference standard and enter it as the "Low Reference" value in the same manner.

#### To calibrate the "High Point":

- 1. The "High Point" Calibration is done in a similar way as the "Low Point".
- 2. Supply a pressure to the Pressure Port of the module being calibrated, using a pressure standard. This pressure should be as close as possible to the full scale value of the selected pressure module or at least within 20% of that value.
- After the pressure stabilizes, record live reading shown on the Two Point Cal screen and enter this value as the "High Reading" by pressing the High Reading button and entering the number followed by the Check [ ] ] button. Record the "true pressure" obtained from the reference standard and enter it as the "High Reference" value in the same manner.
- 4. After all four values (High Reference, High Reading, Low reference, & Low reading) have been entered, the Adjust button will become active. Press the Adjust button to check and accept the calibration data then press the Save button. The instrument will then prompt with the question "Save Cal Data?" Pressing the check button [

## Linearization

The Linearize Tool [ ] provides a place to record upscale and downscale calibration data and to linearize each transducer using that data. An "as found calibration" can be performed by connecting a suitable pressure standard to the Pressure port of the measurement module being calibrated, and supplying up to11 pressure points across the complete range. The record of the pressures from the pressure standard and the corresponding reading from the devices' module can be recorded and transcribed into the Linearization Matrix. Linearization of each measurement module can be performed from this screen by selecting module channel using the channel button in the top left hand corner.

🚧 Linearization Setup		\rm Menu	
Range: 41000CDL -1.000 210.000 bar			-
Units	barG		
Points	3	1+	
Upscale and Downscale	Off	۲.	r F
Restore Factory Cal		Ľ.	1
Start		1.01945 bar	

Linearization Setup.

The Linearization view automatically populates the screen with 10% increments from the low to high pressure corresponding to the range of the pressure module selected. These values can be changed to reflect the values generated by the standard and the corresponding readings taken from the POC8. Each value from the standard can be entered under the reference column, corresponding Upscale and Downscale readings from the device can be entered in the "Upscale" and "Downscale" columns. To enter a value simply press the number and a key pad will appear (see picture below) where the number can be entered. Press the check button [

·,•	Linearization Calibration			II Ne	w Value		
	41000CDL	-1.000 210	0.007	barG			
	Reference	Upscale	Downscale	Average	↓ -11.55	50	9.550↑
0	-1.000	-1.000	-1.000	-1.000	1	2	3
1	20.100	20.100	20.100	20.100	Т	2	3
2	41.200	41.200	41.200	41.200	4	5	6
з	62.300	62.300	62.300	62.300		_	
4	83.400	83.400	83.400	83.400	7	8	9
5	104.500	104.500	104.500	104.500	+/-	0	-
6	125.600	125.600	125.600	125.600	• /	·	
7	146.700	146.700	146.700	146.700	$\checkmark$	+	×
8	167.800	167.800	167.800	167.800			
9	188.900	188.900	188.900	<b>188.9</b> 00			
10	210.000	210.000	210.000	210.000			

Linearization Values.

The picture above shows some typical values that might be seen in a linearization calibration. In the top right of the Operating Screen is the Graph Icon [ ] that, when pressed, reveals a Linearization Error Graph that gives a visual representation of the errors associated with the values entered in the Linearization screen.

This Linearization error graph shows a scaling that corresponds to the maximum error calculated from the data entered in the Linearization Matrix. It is a good indication of the overall error of the module, and will quickly reveal any gross data entry errors that have been made. To revert back to the Linearization Matrix press the Matrix Icon []].

When satisfied that all values have been entered correctly, press the adjust button and then the save button to save the new calibration data in the transducer memory.

After calibration is complete, return to the Calibration Data View (chapter Calibration Data on page 77) to record the certificate number, calibration interval and the date of calibration. Restoration to factory calibration can also be completed in this view.

## **Head Pressure**

The Head Pressure view [ **1**] provides an automated way to calculate the head pressure offset between a device being tested and the POC8, based on:

- Height: the difference between the device under test and the sensing element in the measurement module inside the POC8
- Gas Density: the media density of the pressure media
- Gas Temperature
- Local Gravity

The Head Pressure view is placed under the password protected area of the operator interface to safeguard against inadvertent activation. It is intended to be used to accurately measure the pressure at an external source that is at a different elevation from the POC8 measurement module sensing that pressure.

The four parameters are used to calculate the pressure that is a result of the different elevations. It should not be used when calibrating POC8. Before calibrating the Head height should be set at zero.

The Head Pressure should not be active when calibrating POC8 measurement modules. Before calibrating the Head height should be set at zero. Difference in height between the laboratory standard and the POC8 during calibration should be factored into the uncertainty analysis.

The picture below shows the Head Pressure screen. The height, gas density (Nitrogen or dry air), gas temperature and local gravity can be entered here based on the specific setup of the system.

📱 Head Pressure		II Menu

## Installing POC8 to MCS200 Module Rack

These instructions apply only if you have bought POC8 and a MCS200 Bench system separately and want to install POC8 into MCS200's Module Rack.

Before opening MCS200's Module Rack and working inside it, ensure all electrical power as well as pressure supplies are off.

Ensure that you have a Bench Mounting Kit available. It includes the following items:

- Front panel plate with a hole for POC8 and a connector for pressure control/measurement,
- installation plate to be fixed inside the Module Rack,
- two clamps to fix POC8 to the installation plate and
- a set of bolts, nuts and washers.

Installing POC8 into an MCS200's Module Rack.

#### **Installation Procedure**

Placement of installation plate.

- Align the installation plate inside the module rack as presented in the picture above (red arrow).
- Start fixing the plate from the oval holes (marked with **2.** in the picture above). Locate corresponding square holes in the bottom of the module rack.
- Drill 7 mm holes in the module rack, using the holes marked with **1.** as guides. Fix the installation plate from the holes. Push the bolts from the bottom of the module rack. See picture below.
- Push a bolt from the bottom at holes marked **3.** in the pictures above and below and fix it

Fixing the installation plate.

- Place POC8 on the installation plate and push POC8 into the module rack until POC8 meets the stopper at the back of installation plate.
- Fix the front panel plate to MCS200.
- Fix POC8 using the clamps as shown in the picture above.

#### Connections

After POC8 is installed into MCS200's module rack, do the connections as shown in the picture below.
