

BEAMEX ENVIRONMENTAL POLICY

At Beamex, we are committed to fostering a sustainable future by minimizing our environmental impact and promoting responsible practices across all aspects of our operations.

We believe that by integrating sustainability into our business strategy, we can contribute to a healthier planet and a more resilient community. At Beamex, this translates to:

Product design and end-of-life

We take steps to reduce our environmental impact by encouraging the use of recyclable materials within the company and designing products with long lifecycles to minimize waste.

This is achieved by training and engaging our product development teams in the environmental impacts of product design and end-of-life processes at an early stage together with our suppliers.

Through the Beamex Care Plan and our tailored modular product design, we encourage customers to send their devices back to Beamex service for repair, recalibration, and modular upgrades and improvements. We aim for Beamex products to have a long operating life.

Energy use and GHG emissions

We are committed to reducing the carbon footprint of our operations by measuring, monitoring, and analyzing our energy consumption and Scope 1 and Scope 2 emissions.

We use 100% renewable electricity and district heating and invest in energy efficiency at our premises, for example through heat pumps and LED lighting. We also reduce emissions by using biodiesel instead of conventional diesel.

We continuously improve our monitoring and reporting to support the development of our manufacturing processes.

To reduce our Scope 3 emissions, Beamex requires that all travel aligns with our values of minimizing environmental, social, and economic impacts. We assess our suppliers' environmental performance and integrate the environmental impact of transportation and distribution, including the delivery of products to customers, into our decision-making.

Environmentally responsible product design reduces material consumption, minimizes waste, and thereby lowers emissions.

Chemicals and Water Use

We strive to use environmentally friendly chemicals and minimize water usage in our operations. Chemical use is monitored, and Safety Data Sheets (SDS) for all chemicals are stored in an online platform accessible to all employees.

We identify and manage environmental risks through regular risk assessments to prevent incidents such as local pollution and chemical hazards.

Carbon handprint

We help our customers optimize their processes and minimize production and energy losses by developing and providing calibration solutions that support digitalization and paperless operations. This, in turn, reduces the overall environmental impact of our operations.

Environmental Targets

Our Scope 1 and Scope 2 emissions are negligible and expected to reach zero with the use of biodiesel. We are committed to maintaining this level and ensuring alignment with a 1.5°C pathway, consistent with the Science Based Targets initiative (SBTi).

We have calculated and assessed our Scope 3 greenhouse gas (GHG) emissions and are committed to reducing them, focusing on our most significant categories such as purchased goods and services, transportation and distribution, and business travel.

We are committed to maintaining a waste recovery rate above 95%, with a target to achieve a recycling rate of 50%.

Governance

The Chief Executive Officer (CEO), supported by the Beamex Environmental Management team, is responsible for the implementation, monitoring and maintenance of this policy.

The policy applies to the entire Beamex Group and is reviewed annually by the top management as part of the Management Review process to ensure its relevance, effectiveness and compliance with applicable legal and other requirements.
